8	Developer Guide	303
8.1	Generating Umpire host-config files	303
Index		307

Umpire is a resource management library that allows the discovery, provision, and management of memory on next-generation hardware architectures with NUMA memory hierarchies.

- Take a look at our Getting Started guide for all you need to get up and running with Umpire.
- If you are looking for developer documentation on a particular function, check out the code documentation.
- Want to contribute? Take a look at our developer and contribution guides.

Any questions? File an issue on GitHub, or email umpire-dev@llnl.gov

GETTING STARTED

This page provides information on how to quickly get up and running with Umpire.

1.1 Installation

Umpire is hosted on GitHub [here](#). To clone the repo into your local working space, type:

```
$ git clone --recursive https://github.com/LLNL/Umpire.git
```

The `--recursive` argument is required to ensure that the `BLT` submodule is also checked out. `BLT` is the build system we use for Umpire.

1.1.1 Building Umpire

Umpire uses CMake and BLT to handle builds. Make sure that you have a modern compiler loaded and the configuration is as simple as:

```
$ mkdir build && cd build
$ cmake ../
```

By default, Umpire will only support host memory. Additional backends for device support can be enabled using the options detailed in [Advanced Configuration](#). CMake will provide output about which compiler is being used and the values of other options. Once CMake has completed, Umpire can be built with Make:

```
$ make
```

For more advanced configuration options, see [Advanced Configuration](#).

1.1.2 Installing Umpire

To install Umpire, just run:

```
$ make install
```

Umpire install files to the `lib`, `include` and `bin` directories of the `CMAKE_INSTALL_PREFIX`. Additionally, Umpire installs a CMake configuration file that can help you use Umpire in other projects. By setting `umpire_DIR` to point to the root of your Umpire installation, you can call `find_package(umpire)` inside your CMake project and Umpire will be automatically detected and available for use.

1.2 Basic Usage

Let's take a quick tour through Umpire's most important features. A complete listing you can compile is included at the bottom of the page. First, let's grab an Allocator and allocate some memory. This is the interface through which you will want to access data:

```
auto& rm = umpire::ResourceManager::getInstance();
umpire::Allocator allocator = rm.getAllocator("HOST");

float* my_data = static_cast<float*>(allocator.allocate(100*sizeof(float)));
```

This code grabs the default allocator for the host memory, and uses it to allocate an array of 100 floats. We can ask for different Allocators to allocate memory in different places. Let's ask for a device allocator:

```
umpire::Allocator device_allocator = rm.getAllocator("DEVICE");

float* my_data_device = static_cast<float*>(device_allocator.
    ~allocate(100*sizeof(float));
```

This code gets the default device allocator, and uses it to allocate an array of 100 floats. Remember, since this is a device pointer, there is no guarantee you will be able to access it on the host. Luckily, Umpire's ResourceManager can copy one pointer to another transparently. Let's copy the data from our first pointer to the DEVICE-allocated pointer.

```
rm.copy(my_data, my_data_device);
```

To free any memory allocated, you can use the deallocate function of the Allocator, or the ResourceManager. Asking the ResourceManager to deallocate memory is slower, but useful if you don't know how or where an allocation was made:

```
allocator.deallocate(my_data); // deallocate using Allocator
rm.deallocate(my_data_device); // deallocate using ResourceManager
```

UMPIRE TUTORIAL

This section is a tutorial introduction to Umpire. We start with the most basic memory allocation, and move through topics like allocating on different resources, using allocation strategies to change how memory is allocated, using operations to move and modify data, and how to use Umpire introspection capability to find out information about Allocators and allocations.

These examples are all built as part of Umpire, and you can find the files in the `examples` directory at the root of the Umpire repository. Feel free to play around and modify these examples to experiment with all of Umpire's functionality.

The following tutorial examples assume a working knowledge of C++ and a general understanding of how memory is laid out in modern heterogeneous computers. The main thing to remember is that in many systems, memory on other execution devices (like GPUs) might not be directly accessible from the CPU. If you try and access this memory your program will error! Luckily, Umpire makes it easy to move data around, and check where it is, as you will see in the following sections.

2.1 Allocators

The fundamental concept for accessing memory through Umpire is the `umpire::Allocator`. An `umpire::Allocator` is a C++ object that can be used to allocate and deallocate memory, as well as query a pointer to get some extra information about it.

All `umpire::Allocator`s are created and managed by Umpire's `umpire::ResourceManager`. To get an Allocator, you need to ask for one:

```
umpire::Allocator allocator = rm.getAllocator("HOST");
```

Once you have an `umpire::Allocator` you can use it to allocate and deallocate memory:

```
double* data =
    static_cast<double*>(allocator.allocate(SIZE * sizeof(double)));  
  
allocator.deallocate(data);
```

In the next section, we will see how to allocate memory using different resources.

```

// project contributors. See the COPYRIGHT file for details.  
//  
// SPDX-License-Identifier: (MIT)  
//////////
```

(continues on next page)

(continued from previous page)

```
#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    // _sphinx_tag_tut_get_allocator_start
    umpire::Allocator allocator = rm.getAllocator("HOST");
    // _sphinx_tag_tut_get_allocator_end

    constexpr std::size_t SIZE = 1024;

    // _sphinx_tag_tut_allocate_start
    double* data =
        static_cast<double*>(allocator.allocate(SIZE * sizeof(double)));
    // _sphinx_tag_tut_allocate_end

    std::cout << "Allocated " << (SIZE * sizeof(double)) << " bytes using the "
        << allocator.getName() << " allocator...";

    // _sphinx_tag_tut_deallocate_start
    allocator.deallocate(data);
    // _sphinx_tag_tut_deallocate_end

    std::cout << " deallocated." << std::endl;

    return 0;
}
```

2.2 Resources

Each computer system will have a number of distinct places in which the system will allow you to allocate memory. In Umpire’s world, these are *memory resources*. A memory resource can correspond to a hardware resource, but can also be used to identify memory with a particular characteristic, like “pinned” memory in a GPU system.

When you configure Umpire, it will create `umpire::resource::MemoryResource`s according to what is available on the system you are building for. For each resource (defined by `MemoryResourceTraits::resource_type`), Umpire will create a default `umpire::Allocator` that you can use. In the previous example, we were actually using an `umpire::Allocator` created for the memory resource corresponding to the CPU memory.

The easiest way to identify resources is by name. The “HOST” resource is always available. We also have resources that represent global GPU memory (“DEVICE”), constant GPU memory (“DEVICE_CONST”), unified memory that can be accessed by the CPU or GPU (“UM”), host memory that can be accessed by the GPU (“PINNED”), and mmapped file memory (“FILE”). If an incorrect name is used or if the allocator was not set up correctly, the “UNKNOWN” resource name is returned.

Umpire will create an `umpire::Allocator` for each of these resources, and you can get them using the same `umpire::ResourceManager::getAllocator()` call you saw in the previous example:

```
umpire::Allocator allocator = rm.getAllocator(resource);
```

Note that since every allocator supports the same calls, no matter which resource it is for, this means we can run the same code for all the resources available in the system.

While using Umpire memory resources, it may be useful to query the memory resource currently associated with a particular allocator. For example, if we wanted to double check that our allocator is using the device resource, we can assert that `MemoryResourceTraits::resource_type::device` is equal to the return value of `allocator.getAllocationStrategy()->getTraits().resource`. The test code provided in `memory_resource_traits_tests.cpp` shows a complete example of how to query this information.

Note: In order to test some memory resources, you may need to configure your Umpire build to use a particular platform (a member of the `umpire::Allocator`, defined by `Platform.hpp`) that has access to that resource. See the [Developer's Guide](#) for more information.

Next, we will see an example of how to move data between resources using operations.

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"

void allocate_and_deallocate(const std::string& resource)
{
    auto& rm = umpire::ResourceManager::getInstance();

    // _sphinx_tag_tut_get_allocator_start
    umpire::Allocator allocator = rm.getAllocator(resource);
    // _sphinx_tag_tut_get_allocator_end

    constexpr std::size_t SIZE = 1024;

    double* data =
        static_cast<double*>(allocator.allocate(SIZE * sizeof(double)));

    std::cout << "Allocated " << (SIZE * sizeof(double)) << " bytes using the "
        << allocator.getName() << " allocator...";

    allocator.deallocate(data);

    std::cout << " deallocated." << std::endl;
}

int main(int, char**)
{
    allocate_and_deallocate("HOST");

#if defined(UMPIRE_ENABLE_CUDA)
    allocate_and_deallocate("DEVICE");
    allocate_and_deallocate("UM");
    allocate_and_deallocate("PINNED");
#endif
#if defined(UMPIRE_ENABLE_HIP)
    allocate_and_deallocate("DEVICE");
    allocate_and_deallocate("PINNED");
#endif
}
```

(continues on next page)

(continued from previous page)

```
    return 0;  
}
```

2.3 Operations

Moving and modifying data in a heterogenous memory system can be annoying. You have to keep track of the source and destination, and often use vendor-specific APIs to perform the modifications. In Umpire, all data modification and movement is wrapped up in a concept we call *operations*. Full documentation for all of these is available [here](#). The full code listing for each example is include at the bottom of the page.

2.3.1 Copy

Let's start by looking at how we copy data around. The `umpire::ResourceManager` provides an interface to copy that handles figuring out where the source and destination pointers were allocated, and selects the correct implementation to copy the data:

```
rm.copy(dest_data, source_data);
```

This example allocates the destination data using any valid Allocator.

2.3.2 Move

If you want to move data to a new Allocator and deallocate the old copy, Umpire provides a `umpire::ResourceManager::move()` operation.

```
double* dest_data =  
    static_cast<double*>(rm.move(source_data, dest_allocator));
```

The move operation combines an allocation, a copy, and a deallocate into one function call, allowing you to move data without having to have the destination data allocated. As always, this operation will work with any valid destination Allocator.

2.3.3 Memset

Setting a whole block of memory to a value (like 0) is a common operation, that most people know as a memset. Umpire provides a `umpire::ResourceManager::memset()` implementation that can be applied to any allocation, regardless of where it came from:

```
rm.memset(data, 0);
```

2.3.4 Reallocate

Reallocating CPU memory is easy, there is a function designed specifically to do it: `realloc`. When the original allocation was made in a different memory however, you can be out of luck. Umpire provides a `umpire::ResourceManager::reallocate()` operation:

```
data = static_cast<double*>(rm.reallocate(data, REALLOCATED_SIZE));
```

This method returns a pointer to the reallocated data. Like all operations, this can be used regardless of the Allocator used for the source data.

2.3.5 Listings

data = static_cast<double*>(rm.reallocate(data, REALLOCATED_SIZE));
// _sphinx_tag_tut_realloc_end

std::cout << "done. Reallocated data (" << data << ")" << std::endl;

allocator.deallocate(data);
}

return 0;
}

```

2.4 Dynamic Pools

Frequently allocating and deallocating memory can be quite costly, especially when you are making large allocations or allocating on different memory resources. To mitigate this, Umpire provides allocation strategies that can be used to customize how data is obtained from the system.

In this example, we will look at the `umpire::strategy::DynamicPool` strategy. This is a simple pooling algorithm that can fulfill requests for allocations of any size. To create a new Allocator using the `umpire::strategy::DynamicPool` strategy:

```

auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    resource + "_pool", allocator);

```

We have to provide a new name for the Allocator, as well as the underlying Allocator we wish to use to grab memory.

Once you have an Allocator, you can allocate and deallocate memory as before, without needing to worry about the underlying algorithm used for the allocations:

```

double* data =
    static_cast<double*>(pooled_allocator.allocate(SIZE * sizeof(double)));
}

pooled_allocator.deallocate(data);

```

Don't forget, these strategies can be created on top of any valid Allocator:

```

allocate_and_deallocate_pool("HOST");

#if defined(UMPIRE_ENABLE_CUDA)
    allocate_and_deallocate_pool("DEVICE");
    allocate_and_deallocate_pool("UM");
    allocate_and_deallocate_pool("PINNED");
#endif
#if defined(UMPIRE_ENABLE_HIP)
    allocate_and_deallocate_pool("DEVICE");
    allocate_and_deallocate_pool("PINNED");
#endif

```

Most Umpire users will make allocations that use the GPU via the `umpire::strategy::DynamicPool`, to help mitigate the cost of allocating memory on these devices.

You can tune the way that `umpire::strategy::DynamicPool` allocates memory using two parameters: the initial size, and the minimum size. The initial size controls how large the first underlying allocation made will be, regardless of the requested size. The minimum size controls the minimum size of any future underlying allocations. These two parameters can be passed when constructing a pool:

```

auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    resource + "_pool", allocator, initial_size, /* default = 512Mb */
    min_block_size /* default = 1Mb */);

```

Depending on where you are allocating data, you might want to use different sizes. It's easy to construct multiple pools with different configurations:

```

allocate_and_deallocate_pool("HOST", 65536, 512);
#if defined(UMPIRE_ENABLE_CUDA)
    allocate_and_deallocate_pool("DEVICE", (1024 * 1024 * 1024), (1024 * 1024));
    allocate_and_deallocate_pool("UM", (1024 * 64), 1024);
    allocate_and_deallocate_pool("PINNED", (1024 * 16), 1024);
#endif
#if defined(UMPIRE_ENABLE_HIP)
    allocate_and_deallocate_pool("DEVICE", (1024 * 1024 * 1024), (1024 * 1024));
    allocate_and_deallocate_pool("PINNED", (1024 * 16), 1024);
#endif

```

There are lots of different strategies that you can use, we will look at some of them in this tutorial. A complete list of strategies can be found [here](#).

void allocate_and_deallocate_pool(const std::string& resource,
                                 std::size_t initial_size,
                                 std::size_t min_block_size)
{
    constexpr std::size_t SIZE = 1024;

```

(continues on next page)

(continued from previous page)

```

auto& rm = umpire::ResourceManager::getInstance();

auto allocator = rm.getAllocator(resource);

// _sphinx_tag_tut_allocator_tuning_start
auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    resource + "_pool", allocator, initial_size, /* default = 512Mb*/
    min_block_size /* default = 1Mb */);
// _sphinx_tag_tut_allocator_tuning_end

double* data =
    static_cast<double*>(pooled_allocator.allocate(SIZE * sizeof(double)));

std::cout << "Allocated " << (SIZE * sizeof(double)) << " bytes using the "
    << pooled_allocator.getName() << " allocator...";

pooled_allocator.deallocate(data);

std::cout << " deallocated." << std::endl;
}

int main(int, char**)
{
    // _sphinx_tag_tut_device_sized_pool_start
    allocate_and_deallocate_pool("HOST", 65536, 512);
#if defined(UMPIRE_ENABLE_CUDA)
    allocate_and_deallocate_pool("DEVICE", (1024 * 1024 * 1024), (1024 * 1024));
    allocate_and_deallocate_pool("UM", (1024 * 64), 1024);
    allocate_and_deallocate_pool("PINNED", (1024 * 16), 1024);
#endif
#if defined(UMPIRE_ENABLE_HIP)
    allocate_and_deallocate_pool("DEVICE", (1024 * 1024 * 1024), (1024 * 1024));
    allocate_and_deallocate_pool("PINNED", (1024 * 16), 1024);
#endif
    // _sphinx_tag_tut_device_sized_pool_end

    return 0;
}

```

2.5 Introspection

When writing code to run on computers with a complex memory hierarchy, one of the most difficult things can be keeping track of where each pointer has been allocated. Umpire's introspection capability keeps track of this information, as well as other useful bits and pieces you might want to know.

The `umpire::ResourceManager` can be used to find the allocator associated with an address:

```
auto found_allocator = rm.getAllocator(data);
```

Once you have this, it's easy to query things like the name of the Allocator or find out the associated `umpire::Platform`, which can help you decide where to operate on this data:

```
std::cout << "According to the ResourceManager, the Allocator used is "
<< found_allocator.getName() << ", which has the Platform "
<< static_cast<int>(found_allocator.getPlatform()) << std::endl;
```

You can also find out how big the allocation is, in case you forgot:

```
std::cout << "The size of the allocation is << "
<< found_allocator.getSize(data) << std::endl;
```

Remember that these functions will work on any allocation made using an Allocator or `umpire::TypedAllocator`.

```

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"

int main(int, char**)
{
    constexpr std::size_t SIZE = 1024;

    auto& rm = umpire::ResourceManager::getInstance();

    const std::string destinations[] = {
        "HOST"
#if defined(UMPIRE_ENABLE_CUDA)
        ,
        "DEVICE",
        "UM",
        "PINNED"
#endif
#if defined(UMPIRE_ENABLE_HIP)
        ,
        "DEVICE",
        "PINNED"
#endif
    };

    for (auto& destination : destinations) {
        auto allocator = rm.getAllocator(destination);
        double* data =
            static_cast<double*>(allocator.allocate(SIZE * sizeof(double)));

        std::cout << "Allocated " << (SIZE * sizeof(double)) << " bytes using the "
             << allocator.getName() << " allocator." << std::endl;

        // _sphinx_tag_tut_getallocator_start
        auto found_allocator = rm.getAllocator(data);
        // _sphinx_tag_tut_getallocator_end

        // _sphinx_tag_tut_getinfo_start
        std::cout << "According to the ResourceManager, the Allocator used is "
             << found_allocator.getName() << ", which has the Platform "
    }
}
```

(continues on next page)

(continued from previous page)

```

        << static_cast<int>(found_allocator.getPlatform()) << std::endl;
// _sphinx_tag_tut_getinfo_end

// _sphinx_tag_tut_getsize_start
std::cout << "The size of the allocation is << "
        << found_allocator.getSize(data) << std::endl;
// _sphinx_tag_tut_getsize_end

allocator.deallocate(data);
}

return 0;
}

```

2.6 Typed Allocators

Sometimes, you might want to construct an allocator that allocates objects of a specific type. Umpire provides a `umpire::TypedAllocator` for this purpose. It can also be used with STL objects like `std::vector`.

A `umpire::TypedAllocator` is constructed from any existing Allocator, and provides the same interface as the normal `umpire::Allocator`. However, when you call `allocate`, this argument is the number of objects you want to allocate, no the total number of bytes:

```

umpire::TypedAllocator<double> double_allocator{alloc};

double* my_doubles = double_allocator.allocate(1024);

double_allocator.deallocate(my_doubles, 1024);

```

To use this allocator with an STL object like a vector, you need to pass the type as a template parameter for the vector, and also pass the allocator to the vector when you construct it:

```

std::vector<double, umpire::TypedAllocator<double>> my_vector{
    double_allocator};

```

One thing to remember is that whatever allocator you use with an STL object, it must be compatible with the inner workings of that object. For example, if you try and use a “DEVICE”-based allocator it will fail, since the vector will try and construct each element. The CPU cannot access DEVICE memory in most systems, thus causing a segfault. Be careful!

```

///////////////////////////////
#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/TypedAllocator.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();
    auto alloc = rm.getAllocator("HOST");

```

(continues on next page)

(continued from previous page)

```
// _sphinx_tag_tut_typed_alloc_start
umpire::TypedAllocator<double> double_allocator{alloc};

double* my_doubles = double_allocator.allocate(1024);

double_allocator.deallocate(my_doubles, 1024);
// _sphinx_tag_tut_typed_alloc_end

// _sphinx_tag_tut_vector_alloc_start
std::vector<double, umpire::TypedAllocator<double>> my_vector{
    double_allocator};
// _sphinx_tag_tut_vector_alloc_end

my_vector.resize(100);

return 0;
}
```

2.7 Replay

Umpire provides a lightweight replay capability that can be used to investigate performance of particular allocation patterns and reproduce bugs.

2.7.1 Input Example

A log can be captured and stored as a JSON file, then used as input to the `replay` application (available under the `bin` directory). The `replay` program will read the replay log, and recreate the events that occurred as part of the run that generated the log.

The file `tut_replay.cpp` makes a `umpire::strategy::DynamicPool`:

```
auto allocator = rm.getAllocator("HOST");
auto pool =
    rm.makeAllocator<umpire::strategy::DynamicPool>("pool", allocator);
```

This allocator is used to perform some randomly sized allocations, and later free them:

```
std::generate(allocations.begin(), allocations.end(),
    [&]() { return pool.allocate(random_number()); });

for (auto& ptr : allocations)
    pool.deallocate(ptr);
```

2.7.2 Running the Example

Running this program:

```
UMPIRE_REPLAY="On" ./bin/examples/tutorial/tut_replay > tut_replay_log.json
```

will write Umpire replay events to the file `tut_replay_log.json`. You can see that this file contains JSON formatted lines.

2.7.3 Replaying the session

Loading this file with the replay program will replay this sequence of `umpire::Allocator` creation, allocations, and deallocations:

```
./bin/replay -i ../../examples/tut_replay_log.json
```

We also have a tutorial for the C interface to Umpire. Complete example listings are available, and will be compiled if you have configured Umpire with `-DENABLE_C=On`.

The C tutorial assumes an understanding of C, and it would be useful to have some knowledge of C++ to understand how the C API maps to the native C++ classes that Umpire provides.

2.8 C API: Allocators

The fundamental concept for accessing memory through Umpire is an `umpire::Allocator`. In C, this means using the type `umpire_allocator`. There are corresponding functions that take an `umpire_allocator` and let you allocate and deallocate memory.

As with the native C++ interface, all allocators are accessed via the `umpire::ResourceManager`. In the C API, there is a corresponding `umpire_resourcemanager` type. To get an `umpire_allocator`:

```
umpire_resourcemanager rm;
umpire_resourcemanager_get_instance(&rm);

umpire_allocator allocator;
umpire_resourcemanager_get_allocator_by_name(&rm, "HOST", &allocator);
```

Once you have an `umpire_allocator`, you can use it to allocate and deallocate memory:

```
double* data = (double*) umpire_allocator_allocate(&allocator, SIZE*sizeof(double));

printf("Allocated %lu bytes using the %s allocator...", (SIZE*sizeof(double)), _  
    ↪umpire_allocator_get_name(&allocator));

umpire_allocator_deallocate(&allocator, data);
```

In the next section, we will see how to allocate memory in different places.

2.9 C API: Resources

Each computer system will have a number of distinct places in which the system will allow you to allocate memory. In Umpire's world, these are *memory resources*. A memory resource can correspond to a hardware resource, but can also be used to identify memory with a particular characteristic, like "pinned" memory in a GPU system.

When you configure Umpire, it will create `umpire::resource::MemoryResource`s according to what is available on the system you are building for. For each resource, Umpire will create a default `umpire_allocator` that you can use. In the previous example, we were actually using an `umpire_allocator` created for the memory resource corresponding to the CPU memory.

The easiest way to identify resources is by name. The "HOST" resource is always available. In a system configured with NVIDIA GPUs, we also have resources that represent global GPU memory ("DEVICE"), unified memory that can be accessed by the CPU or GPU ("UM") and host memory that can be accessed by the GPU ("PINNED");

Umpire will create an `umpire_allocator` for each of these resources, and you can get them using the same `umpire_resourcemanager_get_allocator_by_name` call you saw in the previous example:

Note that every allocator supports the same calls, no matter which resource it is for, this means we can run the same code for all the resources available in the system:

As you can see, we can call this function with any valid resource name:

In the next example, we will learn how to move data between resources using operations.

2.10 C API: Pools

Frequently allocating and deallocating memory can be quite costly, especially when you are making large allocations or allocating on different memory resources. To mitigate this, Umpire provides allocation strategies that can be used to customize how data is obtained from the system.

In this example, we will look at creating a pool that can fulfill requests for allocations of any size. To create a new `umpire_allocator` using the pooling algorithm:

The two arguments are the size of the initial block that is allocated, and the minimum size of any future blocks. We have to provide a new name for the allocator, as well as the underlying `umpire_allocator` we wish to use to grab memory.

Once you have the allocator, you can allocate and deallocate memory as before, without needing to worry about the underlying algorithm used for the allocations:

This pool can be created with any valid underlying `umpire_allocator`.

Finally, we have a tutorial for Umpire's FORTRAN API. These examples will be compiled when configuring with `--ENABLE_FORTRAN=On`. The FORTRAN tutorial assumes an understanding of FORTRAN. Familiarity with the FORTRAN's ISO C bindings can be useful for understanding why the interface looks the way it does.

2.11 FORTRAN API: Allocators

The fundamental concept for accessing memory through Umpire is an `umpire::Allocator`. In FORTRAN, this means using the type `UmpireAllocator`. This type provides an `allocate_pointer` function to allocate raw memory, and a generic `allocate` procedure that takes an array pointer and an array of dimensions and will allocate the correct amount of memory.

As with the native C++ interface, all allocators are accessed via the `umpire::ResourceManager`. In the FORTRAN API, there is a corresponding `UmpireResourceManager` type. To get an `UmpireAllocator`:

```
rm = rm%get_instance()
allocator = rm%get_allocator_by_id(0)
```

In this example we fetch the allocator by id, using 0 means you will always get a host allocator. Once you have an `UmpireAllocator`, you can use it to allocate and deallocate memory:

```
call allocator%allocate(array, [ 10 ])
write(10,*) "Allocated array of size ", 10
call allocator%deallocate(array)
```

In this case, we allocate a one-dimensional array using the generic `allocate` function.

ADVANCED CONFIGURATION

In addition to the normal options provided by CMake, Umpire uses some additional configuration arguments to control optional features and behavior. Each argument is a boolean option, and can be turned on or off:

```
-DENABLE_CUDA=Off
```

Here is a summary of the configuration options, their default value, and meaning:

Variable	De-fault	Meaning
ENABLE_CUDA	Off	Enable CUDA support
ENABLE_HIP	Off	Enable HIP support
ENABLE_NUMA	Off	Enable NUMA support
ENABLE_FILE_RESOURCE	Off	Enable FILE support
ENABLE_STATISTICS	Off	Enable collection of memory statistics
ENABLE_TESTS	On	Build test executables
ENABLE_BENCHMARKS	On	Build benchmark programs
ENABLE_LOGGING	On	Enable Logging within Umpire
ENABLE_SLIC	Off	Enable SLIC logging
ENABLE_BACKTRACE	Off	Enable backtraces for allocations
ENABLE_BACKTRACE_SYMBOLS	Off	Enable symbol lookup for backtraces
ENABLE_TOOLS	Off	Enable tools like replay
ENABLE_DOCS	Off	Build documentation (requires Sphinx and/or Doxygen)
ENABLE_C	Off	Build the C API
ENABLE_FORTRAN	Off	Build the Fortran API
ENABLE_PERFORMANCE_TESTS	Off	Build and run performance tests

These arguments are explained in more detail below:

- **ENABLE_CUDA** This option enables support for NVIDIA GPUs using the CUDA programming model. If Umpire is built without CUDA or HIP support, then only the `HOST` allocator is available for use.
- **ENABLE_HIP** This option enables support for AMD GPUs using the ROCm stack and HIP programming model. If Umpire is built without CUDA or HIP support, then only the `HOST` allocator is available for use.
- **ENABLE_NUMA** This option enables support for NUMA. The `umpire::strategy::NumaPolicy` is available when built with this option, which may be used to locate the allocation to a specific node.
- **ENABLE_FILE_RESOURCE** This option will allow the build to make all File Memory Allocation files. If Umpire is built without FILE, CUDA or HIP support, then only the `HOST` allocator is available for use.

- `ENABLE_STATISTICS` This option enables collection of memory statistics. If Umpire is built with this option, the Conduit library will also be built.
- `ENABLE_TESTS` This option controls whether or not test executables will be built.
- `ENABLE_BENCHMARKS` This option will build the benchmark programs used to test performance.
- `ENABLE_LOGGING` This option enables usage of Logging services for Umpire
- `ENABLE_SLIC` This option enables usage of logging services provided by SLIC.
- `ENABLE_BACKTRACE` This option enables collection of backtrace information for each allocation.
- `ENABLE_BACKTRACE_SYMBOLS` This option enables symbol information to be provided with backtraces. This requires `-ldl` to be specified for using programs.
- `ENABLE_TOOLS` Enable development tools for Umpire (replay, etc.)
- `ENABLE_DOCS` Build user documentation (with Sphinx) and code documentation (with Doxygen)
- `ENABLE_C` Build the C API, this allows accessing Umpire Allocators and the ResourceManager through a C interface.
- `ENABLE_FORTRAN` Build the Fortran API.
- `ENABLE_PERFORMANCE_TESTS` Build and run performance tests

UMPIRE COOKBOOK

This section provides a set of recipes that show you how to accomplish specific tasks using Umpire. The main focus is things that can be done by composing different parts of Umpire to achieve a particular use case.

Examples include being able to grow and shrink a pool, constructing Allocators that have introspection disabled for improved performance, and applying CUDA “memory advise” to all the allocations in a particular pool.

4.1 Growing and Shrinking a Pool

When sharing a pool between different parts of your application, or even between co-ordinating libraries in the same application, you might want to grow and shrink a pool on demand. By limiting the size of a pool using device memory, you leave more space on the GPU for “unified memory” to move data there.

The basic idea is to create a pool that allocates a block of your minimum size, and then allocate a single word from this pool to ensure the initial block is never freed:

```
auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    "GPU_POOL", allocator, 4ul * 1024ul * 1024ul * 1024ul + 1);
```

To increase the pool size you can preallocate a large chunk and then immediately free it. The pool will retain this memory for use by later allocations:

```
void* grow = pooled_allocator.allocate(8ul * 1024ul * 1024ul * 1024ul);
pooled_allocator.deallocate(grow);

std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
     << " bytes of memory. " << pooled_allocator.getCurrentSize()
     << " bytes are used" << std::endl;
```

Assuming that there are no allocations left in the larger “chunk” of the pool, you can shrink the pool back down to the initial size by calling `umpire::Allocator::release()`:

```
pooled_allocator.release();
std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
     << " bytes of memory. " << pooled_allocator.getCurrentSize()
     << " bytes are used" << std::endl;
```

The complete example is included below:

```
///////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
```

(continues on next page)

(continued from previous page)

```

//include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/util/Macros.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    auto allocator = rm.getAllocator("DEVICE");

    //
    // Create a 4 Gb pool and reserve one word (to maintain alignment)
    //
    // _sphinx_tag_tut_create_pool_start
    auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "GPU_POOL", allocator, 4ul * 1024ul * 1024ul * 1024ul + 1);
    // _sphinx_tag_tut_create_pool_end

    void* hold = pooled_allocator.allocate(64);
    UMPIRE_USE_VAR(hold);

    std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
           << " bytes of memory. " << pooled_allocator.getCurrentSize()
           << " bytes are used" << std::endl;

    //
    // Grow pool to ~12 by grabbing a 8Gb chunk
    //
    // _sphinx_tag_tut_grow_pool_start
    void* grow = pooled_allocator.allocate(8ul * 1024ul * 1024ul * 1024ul);
    pooled_allocator.deallocate(grow);

    std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
           << " bytes of memory. " << pooled_allocator.getCurrentSize()
           << " bytes are used" << std::endl;
    // _sphinx_tag_tut_grow_pool_end

    //
    // Shrink pool back to ~4Gb
    //
    // _sphinx_tag_tut_shrink_pool_back_start
    pooled_allocator.release();
    std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
           << " bytes of memory. " << pooled_allocator.getCurrentSize()
           << " bytes are used" << std::endl;
    // _sphinx_tag_tut_shrink_pool_back_end

    return 0;
}
```

4.2 Disable Introspection

If you know that you won't be using any of Umpire's introspection capabilities for allocations that come from a particular `umpire::Allocator`, you can turn off the introspection and avoid the overhead of tracking the associated metadata.

Warning: Disabling introspection means that allocations from this Allocator cannot be used for operations, or size and location queries.

In this recipe, we look at disabling introspection for a pool. To turn off introspection, you pass a boolean as the second template parameter to the `umpire::ResourceManager::makeAllocator()` method:

```
auto pooled_allocator =
    rm.makeAllocator<umpire::strategy::DynamicPool, false>(
        "NO_INTROSPECTION_POOL", allocator);
```

Remember that disabling introspection will stop tracking the size of allocations made from the pool, so the `umpire::Allocator::getCurrentSize()` method will return 0:

```
std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
    << " bytes of memory. " << pooled_allocator.getCurrentSize()
    << " bytes are used" << std::endl;
```

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
///////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/util/Macros.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    auto allocator = rm.getAllocator("HOST");

    //
    // Create a pool with introspection disabled (can improve performance)
    //
    // _sphinx_tag_tut_nointro_start
    auto pooled_allocator =
        rm.makeAllocator<umpire::strategy::DynamicPool, false>(
            "NO_INTROSPECTION_POOL", allocator);
    // _sphinx_tag_tut_nointro_end

    void* data = pooled_allocator.allocate(1024);
```

(continues on next page)

(continued from previous page)

```
// _sphinx_tag_tut_getsize_start
std::cout << "Pool has allocated " << pooled_allocator.getActualSize()
    << " bytes of memory. " << pooled_allocator.getCurrentSize()
    << " bytes are used" << std::endl;
// _sphinx_tag_tut_getsize_end

pooled_allocator.deallocate(data);

return 0;
}
```

4.3 Apply Memory Advice to a Pool

When using unified memory on systems with CUDA GPUs, various types of memory advice can be applied to modify how the CUDA runtime moves this memory around between the CPU and GPU. One type of advice that can be applied is “preferred location”, and you can specify where you want the preferred location of the memory to be. This can be useful for ensuring that the memory is kept on the GPU.

By creating a pool on top of an `umpire::strategy::AllocationAdvisor`, you can amortize the cost of applying memory advice:

```
// 
// Create an allocator that applied "PREFERRED_LOCATION" advice to set the
// GPU as the preferred location.
//
auto preferred_location_allocator =
    rm.makeAllocator<umpire::strategy::AllocationAdvisor>(
        "preferred_location_device", allocator, "PREFERRED_LOCATION");

//
// Create a pool using the preferred_location_allocator. This makes all
// allocations in the pool have the same preferred location, the GPU.
//
auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    "GPU_POOL", preferred_location_allocator);
```

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
/////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/AllocationAdvisor.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/util/Macros.hpp"

int main(int, char**)
{
```

(continues on next page)

(continued from previous page)

```

auto& rm = umpire::ResourceManager::getInstance();

auto allocator = rm.getAllocator("UM");

// _sphinx_tag_tut_pool_advice_start
//
// Create an allocator that applied "PREFERRED_LOCATION" advice to set the
// GPU as the preferred location.
//
auto preferred_location_allocator =
    rm.makeAllocator<umpire::strategy::AllocationAdvisor>(
        "preferred_location_device", allocator, "PREFERRED_LOCATION");

//
// Create a pool using the preferred_location_allocator. This makes all
// allocations in the pool have the same preferred location, the GPU.
//
auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
    "GPU_POOL", preferred_location_allocator);
// _sphinx_tag_tut_pool_advice_end

UMPIRE_USE_VAR(pooled_allocator);

return 0;
}

```

4.4 Apply Memory Advice with a Specific Device ID

When using unified memory on systems with CUDA GPUs, various types of memory advice can be applied to modify how the CUDA runtime moves this memory around between the CPU and GPU. When applying memory advice, a device ID can be used to specific which device the advice relates to. One type of advice that can be applied is “preferred location”, and you can specifcy where you want the preferred location of the memory to be. This can be useful for ensuring that the memory is kept on the GPU.

By passing a specific device id when constructing an `umpire::strategy::AllocationAdvisor`, you can ensure that the advice will be applied with respect to that device

```

//
// Create an allocator that applied "PREFERRED_LOCATION" advice to set a
// specific GPU device as the preferred location.
//
// In this case, device #2.
//
const int device_id = 2;

try {
    auto preferred_location_allocator =
        rm.makeAllocator<umpire::strategy::AllocationAdvisor>(
            "preferred_location_device_2", allocator, "PREFERRED_LOCATION",
            device_id);
}

```

The complete example is included below:

```
////////////////////////////////////////////////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
////////////////////////////////////////////////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/AllocationAdvisor.hpp"
#include "umpire/util/Exception.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    auto allocator = rm.getAllocator("UM");

    // _sphinx_tag_tut_device_advice_start
    //
    // Create an allocator that applied "PREFERRED_LOCATION" advice to set a
    // specific GPU device as the preferred location.
    //
    // In this case, device #2.
    //
    const int device_id = 2;

    try {
        auto preferred_location_allocator =
            rm.makeAllocator<umpire::strategy::AllocationAdvisor>(
                "preferred_location_device_2", allocator, "PREFERRED_LOCATION",
                device_id);

        // _sphinx_tag_tut_device_advice_end
        void* data = preferred_location_allocator.allocate(1024);

        preferred_location_allocator.deallocate(data);
    } catch (umpire::util::Exception& e) {
        std::cout << "Couldn't create Allocator with device_id = " << device_id
              << std::endl;

        std::cout << e.message() << std::endl;
    }

    return 0;
}
```

4.5 Moving Host Data to Managed Memory

When using a system with NVIDIA GPUs, you may realize that some host data should be moved to unified memory in order to make it accessible by the GPU. You can do this with the `umpire::ResourceManager::move()` operation:

```
double* um_data = static_cast<double*>(rm.move(host_data, um_allocator));
```

The move operation will copy the data from host memory to unified memory, allocated using the provided `um_allocator`. The original allocation in host memory will be deallocated. The complete example is included below:

```
////////////////////////////////////////////////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
////////////////////////////////////////////////////////////////////////
#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"

int main(int, char**)
{
    constexpr std::size_t SIZE = 1024;

    auto& rm = umpire::ResourceManager::getInstance();
    auto allocator = rm.getAllocator("HOST");

    //
    // Allocate host data
    //
    double* host_data =
        static_cast<double*>(allocator.allocate(SIZE * sizeof(double)));

    //
    // Move data to unified memory
    //
    auto um_allocator = rm.getAllocator("UM");
    // _sphinx_tag_tut_move_host_to_managed_start
    double* um_data = static_cast<double*>(rm.move(host_data, um_allocator));
    // _sphinx_tag_tut_move_host_to_managed_end

    //
    // Deallocate um_data, host_data is already deallocated by move operation.
    //
    rm.deallocate(um_data);

    return 0;
}
```

4.6 Improving DynamicPool Performance with a Coalesce Heuristic

As needed, the `umpire::strategy::DynamicPool` will continue to allocate blocks to satisfy allocation requests that cannot be satisfied by blocks currently in the pool it is managing. Under certain application-specific memory allocation patterns, fragmentation within the blocks or allocations that are for sizes greater than the size of the largest available block can cause the pool to grow too large. For example, a problematic allocation pattern is when an application makes several allocations of incrementing size where each allocation is larger than the previous block size allocated.

The `umpire::strategy::DynamicPool::coalesce()` method may be used to cause the `umpire::strategy::DynamicPool` to coalesce the releasable blocks into a single larger block. This is accomplished by: tallying the size of all blocks without allocations against them, releasing those blocks back to the memory resource, and creating a new block of the previously tallied size.

Applications may offer a heuristic function to the `umpire::strategy::DynamicPool` during instantiation that will return true whenever a pool reaches a specific threshold of releasable bytes (represented by completely free blocks) to the total size of the pool. The `DynamicPool` will call this heuristic function just before it returns from its `umpire::strategy::DynamicPool::deallocate()` method and when the function returns true, the `DynamicPool` will call the `umpire::strategy::DynamicPool::coalesce()` method.

The default heuristic of 100 will cause the `DynamicPool` to automatically coalesce when all of the bytes in the pool are releasable and there is more than one block in the pool.

A heuristic of 0 will cause the `DynamicPool` to never automatically coalesce.

Creation of the heuristic function is accomplished by:

```
//  
// Create a heuristic function that will return true to the DynamicPool  
// object when the threshold of releasable size to total size is 75%.  
//  
auto heuristic_function =  
    umpire::strategy::DynamicPool::percent_releasable(75);
```

The heuristic function is then provided as a parameter when the object is instantiated:

```
//  
// Create a pool with an initial block size of 1 Kb and 1 Kb block size for  
// all subsequent allocations and with our previously created heuristic  
// function.  
//  
auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(  
    "HOST_POOL", allocator, 1024ul, 1024ul, 16, heuristic_function);
```

The complete example is included below:

```
///////////  
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire  
// project contributors. See the COPYRIGHT file for details.  
//  
// SPDX-License-Identifier: (MIT)  
///////////  
#include "umpire/Allocator.hpp"  
#include "umpire/ResourceManager.hpp"  
#include "umpire/strategy/DynamicPool.hpp"  
#include "umpire/util/Macros.hpp"  
  
int main(int, char**)
```

(continues on next page)

(continued from previous page)

```

{
    auto& rm = umpire::ResourceManager::getInstance();

    auto allocator = rm.getAllocator("HOST");

    // _sphinx_tag_tut_creat_heuristic_fun_start
    //
    // Create a heuristic function that will return true to the DynamicPool
    // object when the threshold of releasable size to total size is 75%.
    //
    auto heuristic_function =
        umpire::strategy::DynamicPool::percent_releasable(75);
    // _sphinx_tag_tut_creat_heuristic_fun_end

    // _sphinx_tag_tut_use_heuristic_fun_start
    //
    // Create a pool with an initial block size of 1 Kb and 1 Kb block size for
    // all subsequent allocations and with our previously created heuristic
    // function.
    //
    auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "HOST_POOL", allocator, 1024ul, 1024ul, 16, heuristic_function);
    // _sphinx_tag_tut_use_heuristic_fun_end

    //
    // Obtain a pointer to our specific DynamicPool instance in order to see the
    // DynamicPool-specific statistics
    //
    auto dynamic_pool =
        umpire::util::unwrap_allocator<umpire::strategy::DynamicPool>(
            pooled_allocator);

    void* a[4];
    for (int i = 0; i < 4; ++i)
        a[i] = pooled_allocator.allocate(1024);

    for (int i = 0; i < 4; ++i) {
        pooled_allocator.deallocate(a[i]);
        std::cout << "Pool has " << pooled_allocator.getActualSize()
            << " bytes of memory. " << pooled_allocator.getCurrentSize()
            << " bytes are used. " << dynamic_pool->getBlocksInPool()
            << " blocks are in the pool. "
            << dynamic_pool->getReleasableSize() << " bytes are releaseable. "
            << std::endl;
    }

    return 0;
}

```

4.7 Move Allocations Between NUMA Nodes

When using NUMA (cache coherent or non uniform memory access) systems, there are different latencies to parts of the memory. From an application perspective, the memory looks the same, yet especially for high-performance computing it is advantageous to have finer control. `malloc()` attempts to allocate memory close to your node, but it can make no guarantees. Therefore, Linux provides both a process-level interface for setting NUMA policies with the system utility `numactl`, and a fine-grained interface with `libnuma`. These interfaces work on ranges of memory in multiples of the page size, which is the length or unit of address space loaded into a processor cache at once.

A page range may be bound to a NUMA node using the `umpire::strategy::NumaPolicy`. It can therefore also be moved between NUMA nodes using the `umpire::ResourceManager::move()` with a different allocator. The power of using such an abstraction is that the NUMA node can be associated with a device, in which case the memory is moved to, for example, GPU memory.

In this recipe we create an allocation bound to a NUMA node, and move it to another NUMA node.

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
/////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/NumaPolicy.hpp"
#include "umpire/util/Macros.hpp"
#include "umpire/util/numa.hpp"

#if defined(UMPIRE_ENABLE_CUDA)
#include <cuda_runtime_api.h>
#endif

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    const std::size_t alloc_size = 5 * umpire::get_page_size();

    // Get a list of the host NUMA nodes (e.g. one per socket)
    auto host_nodes = umpire::numa::get_host_nodes();

    if (host_nodes.size() < 1) {
        UMPIRE_ERROR("No NUMA nodes detected");
    }

    // Create an allocator on the first NUMA node
    auto host_src_alloc = rm.makeAllocator<umpire::strategy::NumaPolicy>(
        "host_numa_src_alloc", rm.getAllocator("HOST"), host_nodes[0]);

    // Create an allocation on that node
    void* src_ptr = host_src_alloc.allocate(alloc_size);

    if (host_nodes.size() > 1) {
```

(continues on next page)

(continued from previous page)

```

// Create an allocator on another host NUMA node.
auto host_dst_alloc = rm.makeAllocator<umpire::strategy::NumaPolicy>(
    "host numa dst alloc", rm.getAllocator("HOST"), host_nodes[1]);

// Move the memory
void* dst_ptr = rm.move(src_ptr, host_dst_alloc);

// The pointer shouldn't change even though the memory location changes
if (dst_ptr != src_ptr) {
    UMPIRE_ERROR("Pointers should match");
}

// Touch it
rm.memset(dst_ptr, 0);

// Verify NUMA node
if (umpire::numa::get_location(dst_ptr) != host_nodes[1]) {
    UMPIRE_ERROR("Move was unsuccessful");
}
}

#if defined(UMPIRE_ENABLE_DEVICE)
// Get a list of the device nodes
auto device_nodes = umpire::numa::get_device_nodes();

if (device_nodes.size() > 0) {
    // Create an allocator on the first device NUMA node. Note that
    // this still requires using the "HOST" allocator. The allocations
    // are moved after the address space is reserved.
    auto device_alloc = rm.makeAllocator<umpire::strategy::NumaPolicy>(
        "device numa src alloc", rm.getAllocator("HOST"), device_nodes[0]);

    // Move the memory
    void* dst_ptr = rm.move(src_ptr, device_alloc);

    // The pointer shouldn't change even though the memory location changes
    if (dst_ptr != src_ptr) {
        UMPIRE_ERROR("Pointers should match");
    }

    // Touch it -- this currently uses the host memset operation (thus, copying
    // the memory back)
    rm.memset(dst_ptr, 0);

    // Verify NUMA node
    if (umpire::numa::get_location(dst_ptr) != device_nodes[0]) {
        UMPIRE_ERROR("Move was unsuccessful");
    }
}
#endif

// Clean up by deallocating from the original allocator, since the
// allocation record is still associated with that allocator
host_src_alloc.deallocate(src_ptr);

return 0;
}

```

4.8 Determining the Largest Block of Available Memory in Pool

The `umpire::strategy::DynamicPool` provides a `umpire::strategy::DynamicPool::getLargestAvailableBlock` that may be used to determine the size of the largest block currently available for allocation within the pool. To call this function, you must get the pointer to the `umpire::strategy::AllocationStrategy` from the `umpire::Allocator`:

```
auto pool = rm.makeAllocator<umpire::strategy::DynamicPool>(
    "pool", rm.getAllocator("HOST"));

auto dynamic_pool =
    umpire::util::unwrap_allocator<umpire::strategy::DynamicPool>(pool);
```

Once you have the pointer to the appropriate strategy, you can call the function:

```
std::cout << "Largest available block in pool is "
    << dynamic_pool->getLargestAvailableBlock() << " bytes in size"
    << std::endl;
```

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
///////////////////////////////

#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/util/Exception.hpp"
#include "umpire/util/wrap_allocator.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    // _sphinx_tag_tut_unwrap_start
    auto pool = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "pool", rm.getAllocator("HOST"));

    auto dynamic_pool =
        umpire::util::unwrap_allocator<umpire::strategy::DynamicPool>(pool);
    // _sphinx_tag_tut_unwrap_end

    if (dynamic_pool == nullptr) {
        UMPIRE_ERROR(pool.getName() << " is not a DynamicPool");
    }

    auto ptr = pool.allocate(1024);

    // _sphinx_tag_tut_get_info_start
    std::cout << "Largest available block in pool is "
        << dynamic_pool->getLargestAvailableBlock() << " bytes in size"
        << std::endl;
```

(continues on next page)

(continued from previous page)

```
// _sphinx_tag_tut_get_info_end

pool.deallocate(ptr);

return 0;
}
```

4.9 Coalescing Pool Memory

The `umpire::strategy::DynamicPool` provides a `umpire::strategy::DynamicPool::coalesce()` that can be used to release unused memory and allocate a single large block that will be able to satisfy allocations up to the previously observed high-watermark. To call this function, you must get the pointer to the `umpire::strategy::AllocationStrategy` from the `umpire::Allocator`:

```
auto dynamic_pool =
    umpire::util::unwrap_allocator<umpire::strategy::DynamicPool>(pool);
```

Once you have the pointer to the appropriate strategy, you can call the function:

```
dynamic_pool->coalesce();
```

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
///////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/AllocationTracker.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/util/Exception.hpp"
#include "umpire/util/wrap_allocator.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    auto pool = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "pool", rm.getAllocator("HOST"));

    // _sphinx_tag_tut_unwrap_strategy_start
    auto dynamic_pool =
        umpire::util::unwrap_allocator<umpire::strategy::DynamicPool>(pool);
    // _sphinx_tag_tut_unwrap_strategy_end

    if (dynamic_pool) {
        // _sphinx_tag_tut_call_coalesce_start
        dynamic_pool->coalesce();
        // _sphinx_tag_tut_call_coalesce_end
    }
}
```

(continues on next page)

(continued from previous page)

```

} else {
    UMPIRE_ERROR(pool.getName() << " is not a DynamicPool, cannot coalesce!");
}

return 0;
}

```

4.10 Building a Pinned Memory Pool in FORTRAN

In this recipe, we show you how to build a pool in pinned memory using Umpire’s FORTRAN API. These kinds of pools can be useful for allocating buffers to be used in communication routines in various scientific applications.

Building the pool takes two steps: 1) getting a base “PINNED” allocator, and 2) creating the pool:

```

rm = rm%get_instance()
base_allocator = rm%get_allocator_by_name("PINNED")

pinned_pool = rm%make_allocator_pool("PINNED_POOL", &
                                     base_allocator, &
                                     512_8*1024_8, &
                                     1024_8)

```

The complete example is included below:

```

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

program umpire_f_pinned_pool
    use umpire_mod
    implicit none
    logical ok

    integer(C_INT), pointer, dimension(:) :: array(:)
    type(UmpireAllocator) base_allocator
    type(UmpireAllocator) pinned_pool
    type(UmpireResourceManager) rm

    ! _sphinx_tag_tut_pinned_fortran_start
    rm = rm%get_instance()
    base_allocator = rm%get_allocator_by_name("PINNED")

    pinned_pool = rm%make_allocator_pool("PINNED_POOL", &
                                         base_allocator, &
                                         512_8*1024_8, &
                                         1024_8)
    ! _sphinx_tag_tut_pinned_fortran_end

    call pinned_pool%allocate(array, [10])
end program umpire_f_pinned_pool

```

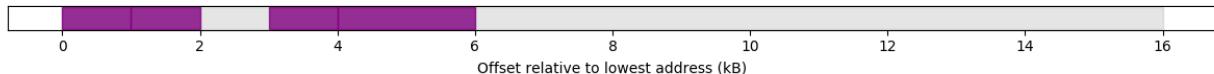

4.11 Visualizing Allocators

The python script `plot_allocations.py` is included with Umpire to plot allocations. This script uses series of three arguments: an output file with allocation records, a color, and an alpha (transparency) value *0.0-1.0*. Although these could be used to plot records from a single allocator, 3 arguments, it can also be used to overlay multiple allocators, by passing 3n arguments after the script name. In this cookbook we use this feature to visualize a pooled allocator.

The cookbook generates two files, `allocator.log` and `pooled_allocator.log`, that contain the allocation records from the underlying allocator and the pool. These can then be plotted using a command similar to the following:

```
tools/plot_allocations allocator.log gray 0.2 pooled_allocator.log purple 0.8
```

That script uses Python and Matplotlib to generate the following image

The complete example is included below:

```
///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
///////////////////////////////
#include <fstream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/Umpire.hpp"
#include "umpire/strategy/DynamicPool.hpp"

int main(int, char**)
{
    auto& rm = umpire::ResourceManager::getInstance();

    auto allocator = rm.getAllocator("HOST");
    auto pooled_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "HOST_POOL", allocator, 1024 * 16);

    void* a[4];
    for (int i = 0; i < 4; ++i)
        a[i] = pooled_allocator.allocate(1024);

    // Create fragmentation
    pooled_allocator.deallocate(a[2]);
    a[2] = pooled_allocator.allocate(1024 * 2);

    // Output the records from the underlying host allocator
    {
        std::ofstream out("allocator.log");
        umpire::print_allocator_records(allocator, out);
        out.close();
    }

    // Output the records from the pooled allocator
    {
```

(continues on next page)

(continued from previous page)

```

    std::ofstream out("pooled_allocator.log");
    umpire::print_allocator_records(pooled_allocator, out);
    out.close();
}

for (int i = 0; i < 4; ++i)
    pooled_allocator.deallocate(a[i]);

// Visualize this using the python script. Example usage:
// tools/analysis/plot_allocations allocator.log gray 0.2 pooled_allocator.log
// purple 0.8

return 0;
}

```

4.12 Mixed Pool Creation and Algorithm Basics

This recipe shows how to create a default mixed pool, and one that might be tailored to a specific application's needs. Mixed pools allocate in an array of `umpire::strategy::FixedPool` for small allocations, because these have simpler bookkeeping and are very fast, and a `umpire::strategy::DynamicPool` for larger allocations.

The class `umpire::strategy::MixedPool` uses a generic choice of `umpire::strategy::FixedPool` of size 256 bytes to 4MB in increments of powers of 2, while `umpire::strategy::MixedPoolImpl` has template arguments that select the first, power of 2 increment, and last fixed pool size.

The complete example is included below:

```

////////////////////////////////////////////////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)
////////////////////////////////////////////////////////////////////////
#include <iostream>

#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/MixedPool.hpp"

int main(int, char **)
{
    auto &rm = umpire::ResourceManager::getInstance();
    auto allocator = rm.getAllocator("HOST");

    /*
     * Create a default mixed pool.
     */
    auto default_mixed_allocator = rm.makeAllocator<umpire::strategy::MixedPool>(
        "default_mixed_pool", allocator);

    UMPIRE_USE_VAR(default_mixed_allocator);

    /*
     * Create a mixed pool using fixed pool bins of size 2^8 = 256 Bytes

```

(continues on next page)

(continued from previous page)

```

* to  $2^{14} = 16$  kB in increments of 5x, where each individual fixed
* pool is kept under 4MB in size to begin.
*/
auto custom_mixed_allocator = rm.makeAllocator<umpire::strategy::MixedPool>(
    "custom_mixed_pool", allocator, 256, 16 * 1024, 4 * 1024 * 1024, 5);

/*
* Although this calls for only 4*4=16 bytes, this allocation will
* come from the smallest fixed pool, thus ptr will actually be the
* first address in a range of 256 bytes.
*/
void *ptr1 = custom_mixed_allocator.allocate(4 * sizeof(int));

/*
* This is too beyond the range of the fixed pools, and therefore is
* allocated from a dynamic pool. The range of address space
* reserved will be exactly what was requested by the allocate()
* method.
*/
void *ptr2 = custom_mixed_allocator.allocate(1 << 18);

/*
* Clean up
*/
custom_mixed_allocator.deallocate(ptr1);
custom_mixed_allocator.deallocate(ptr2);

return 0;
}

```

4.13 Thread Safe Allocator

If you want thread-safe access to allocations that come from a particular `umpire::Allocator`, you can create an instance of a `umpire::strategy::ThreadSafeAllocator` object that will synchronize access to it.

In this recipe, we look at creating a `umpire::strategy::ThreadSafeAllocator` for an `umpire::strategy::DynamicPool` object:

```

auto& rm = umpire::ResourceManager::getInstance();

auto pool = rm.makeAllocator<umpire::strategy::DynamicPool>(
    "pool", rm.getAllocator("HOST"));

auto thread_safe_pool =
    rm.makeAllocator<umpire::strategy::ThreadSafeAllocator>(
        "thread_safe_pool", pool);

```

The complete example is included below:

```

///////////////////////////////
// Copyright (c) 2016-20, Lawrence Livermore National Security, LLC and Umpire
// project contributors. See the COPYRIGHT file for details.
//
// SPDX-License-Identifier: (MIT)

```

(continues on next page)

(continued from previous page)

```
///////////
#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"
#include "umpire/strategy/DynamicPool.hpp"
#include "umpire/strategy/ThreadSafeAllocator.hpp"

int main(int, char**)
{
    // _sphinx_tag_tut_thread_safe_start
    auto& rm = umpire::ResourceManager::getInstance();

    auto pool = rm.makeAllocator<umpire::strategy::DynamicPool>(
        "pool", rm.getAllocator("HOST"));

    auto thread_safe_pool =
        rm.makeAllocator<umpire::strategy::ThreadSafeAllocator>(
            "thread_safe_pool", pool);
    // _sphinx_tag_tut_thread_safe_end

    auto allocation = thread_safe_pool.allocate(256);
    thread_safe_pool.deallocate(allocation);

    return 0;
}
```

4.14 Using File System Allocator (FILE)

Umpire supports the use of file based memory allocation. When `ENABLE_FILE_RESOURCE` is enabled, the environment variables `UMPIRE_MEMORY_FILE_DIR` can be used to determine where memory can be allocated from:

Variable	Default	Description
<code>UMPIRE_MEMORY_FILE_DIR</code>	<code>./</code>	Directory to create and allocate file based allocations

Requesting the allocation takes two steps: 1) getting a “FILE” allocator, 2) requesting the amount of memory to allocate.

```
auto& rm = umpire::ResourceManager::getInstance();
umpire::Allocator alloc = rm.getAllocator("FILE");

std::size_t* A = (std::size_t*)alloc.allocate(sizeof(size_t));
```

To deallocate:

```
alloc.deallocate(A);
```

The complete example is included below:

```

```

(continues on next page)

(continued from previous page)

```
#include "umpire/Allocator.hpp"
#include "umpire/ResourceManager.hpp"

int main(int, char** argv)
{
    // _sphinx_tag_tut_file_allocate_start
    auto& rm = umpire::ResourceManager::getInstance();
    umpire::Allocator alloc = rm.getAllocator("FILE");

    std::size_t* A = (std::size_t*)alloc.allocate(sizeof(size_t));
    // _sphinx_tag_tut_file_allocate_end

    // _sphinx_tag_tut_file_deallocate_start
    alloc.deallocate(A);
    // _sphinx_tag_tut_file_deallocate_end

    return 0;
}
```

4.15 Using Burst Buffers On Lassen

On Lassen, 1) Download the latest version of Umpire 2) request a private node to build:

```
$ git clone --recursive https://github.com/LLNL/Umpire.git
$ lalloc 1 -stage storage=64
```

Note that `-stage storage=64` is needed in order to work with the Burst Buffers. 3) Additionally, the environment variable needs to set to `$BBPATH` :

```
$ export UMPIRE_MEMORY_FILE_DIR=$BBPATH/
```

4.15.1 Running File Resource Benchmarks

Continue building Umpire on 1 node, and set the `-DENABLE_FILE_RESOURCE=On` :

```
$ mkdir build && cd build
$ lrun -n 1 cmake -DENABLE_FILE_RESOURCE=On -DENABLE_OPENMP=On ../ && make
```

To run the built-in benchmarks in Umpire from the build run:

```
$ lrun -n 1 --threads=** ./bin/file_resource_benchmarks ##
```

`**` is a placeholder for the amount of threads wanted to run the benchmark on. `##` stands for the number of array elements wanted to be passed through the benchmark. This number can range from 1-100,000,000,000.

Results should appear like:

```
Array Size: 1           Memory Size: 8e-06 MB
Total Arrays: 3          Total Memory Size: 2.4e-05 MB

HOST
```

```

This benchmark run similar to the STREAM Benchmark test and can also run a benchmark for the additional allocators like UM for CUDA and DEVICE for HIP.

FEATURES

5.1 Allocators

Allocators are the fundamental object used to allocate and deallocate memory using Umpire.

class Allocator

Provides a unified interface to allocate and free data.

An *Allocator* encapsulates all the details of how and where allocations will be made, and can also be used to introspect the memory resource. *Allocator* objects do not return typed allocations, so the pointer returned from the allocate method must be cast to the relevant type.

See *TypedAllocator*

template<typename T>

class TypedAllocator

Allocator for objects of type T.

This class is an adaptor that allows using an *Allocator* to allocate objects of type T. You can use this class as an allocator for STL containers like std::vector.

5.2 Backtrace

The Umpire library may be configured to provide using programs with backtrace information as part of Umpire thrown exception description strings.

Umpire may also be configured to collect and provide backtrace information for each Umpire provided memory allocation performed.

5.2.1 Build Configuration

Backtrace is enabled in Umpire builds with the following:

- ```cmake ... -DENABLE_BACKTRACE=On ...``` to backtrace capability in Umpire.
- ```cmake -DENABLE_BACKTRACE=On -DENABLE_BACKTRACE_SYMBOLS=On ...``` to enable Umpire to display symbol information with backtrace. **Note:** Using programs will need to add the `-rdynamic` and `-ldl` linker flags in order to properly link with this configuration of the Umpire library.

5.2.2 Runtime Configuration

For versions of the Umpire library that are backtrace enabled (from flags above), the user may expect the following.

Backtrace information will always be provided in the description strings of `umpire` generated exception throws.

Setting the environment variable `UMPIRE_BACKTRACE=On` will cause Umpire to record backtrace information for each memory allocation it provides.

Setting the environment variable `UMPIRE_LOG_LEVEL=Error` will cause Umpire to log backtrace information for each of the leaked Umpire allocations found during application exit.

A programmatic interface is also available via the `func::umpire::print_allocator_records` free function.

An example for checking and displaying the information this information logged above may be found here:

//////////  
#include <iostream>  
#include <sstream>  
  
#include "umpire/ResourceManager.hpp"  
#include "umpire/Umpire.hpp"  
#include "umpire/strategy/DynamicPool.hpp"  
  
int main(int, char**)  
{  
    auto& rm = umpire::ResourceManager::getInstance();  
    auto allocator = rm.getAllocator("HOST");  
    auto pool_allocator = rm.makeAllocator<umpire::strategy::DynamicPool>(  
        "host_dynamic_pool", allocator);  
  
    allocator.allocate(16);  
    allocator.allocate(32);  
    allocator.allocate(64);  
  
    pool_allocator.allocate(128);  
    pool_allocator.allocate(256);  
    pool_allocator.allocate(512);  
  
    std::stringstream ss;  
    umpire::print_allocator_records(allocator, ss);  
    umpire::print_allocator_records(pool_allocator, ss);  
  
    // Example #1 of 3 - Leaked allocations  
    //  
    // If Umpire compiled with -DENABLE_BACKTRACE=On, then backtrace  
    // information will be printed for each of the allocations made above.  
    //  
    // Otherwise, if Umpire was not compiled with -DENABLE_BACKTRACE=On,  
    // then only the addresses and size information for each allocation will be  
    // printed.  
    //  
    if (!ss.str().empty())  
        std::cout << ss.str();
```

(continues on next page)

(continued from previous page)

```

// Example #2 of 3 - Umpire error exceptions
//
// When umpire throws an exception, a backtrace to the offending call will
// be provided in the exception string.
//
void* bad_ptr = (void*)0BADBADBAD;

try {
    allocator.deallocate(bad_ptr); // Will cause a throw from umpire
} catch (const std::exception& exc) {
//
// exc.what() string will also contain a backtrace
//
    std::cout << "Exception thrown from Umpire:" << std::endl << exc.what();
}

// Example #3 of 3 - Leak detection
//
// When the program terminates, Umpire's resource manager will be
// deconstructed. During deconstruction, Umpire will log the size and
// address, of each leaked allocation in each allocator.
//
// If Umpire was compiled with -DENABLE_BACKTRACE=On, backtrace
// information will also be logged for each leaked allocation in each
// allocator.
//
// To enable (and see) the umpire logs, set the environment variable
// UMPIRE_LOG_LEVEL=Error.
//
return 0;
}

```

5.3 File I/O

Umpire provides support for writing files containing log and replay data, rather than directing this output to stdout. When logging or replay are enabled, the following environment variables can be used to determine where the output is written:

`UMPIRE_OUTPUT_DIR`. Directory to write log and replay files
`UMPIRE_OUTPUT_BASENAME` umpire
Basename of logging and replay files

The values of these variables are used to construct unique filenames for output. The extension `.log` is used for logging output, and `.replay` for replay output. The filenames additionally contain three integers, one corresponding to the rank of the process, one corresponding to the process ID, and one that is used to make multiple files with the same basename and rank unique. This ensures that multiple runs with the same IO configuration do not overwrite files.

The format of the filenames is:

```
<UMPIRE_OUTPUT_BASENAME>.<RANK>.<PID>.<UID>.<log|replay>
```

If Umpire is compiled without MPI support, then rank will always be 0.

5.4 Logging and Replay of Umpire Events

5.4.1 Logging

When debugging memory operation problems, it is sometimes helpful to enable Umpire's logging facility. The logging functionality is enabled for default builds unless `-DENABLE_LOGGING='Off'` has been specified in which case it is disabled.

If Umpire logging is enabled, it may be controlled by setting the `UMPIRE_LOG_LEVEL` environment variable to Error, Warning, Info, or Debug. The Debug value is the most verbose.

When `UMPIRE_LOG_LEVEL` has been set, events will be logged to the standard output.

5.4.2 Replay

Umpire provides a lightweight replay capability that can be used to investigate performance of particular allocation patterns and reproduce bugs. By running an executable that uses Umpire with the environment variable `UMPIRE_REPLAY` set to `On`, Umpire will emit information for the following Umpire events:

- **version** `umpire::get_major_version()`, `umpire::get_minor_version()`, and `umpire::get_patch_version()`
- **makeMemoryResource** `umpire::resource::MemoryResourceRegistry::makeMemoryResource()`
- **makeAllocator** `umpire::ResourceManager::makeAllocator()`
- **allocate** `umpire::Allocator::allocate()`
- **deallocate** `umpire::Allocator::deallocate()`

5.4.3 Running with Replay

To enable Umpire replay, one may execute as follows:

```
UMPIRE_REPLAY="On" ./my_umpire_using_program > replay_log.json
```

will write Umpire replay events to the file `replay_log.json` that will contain the following kinds of information:

5.4.4 Interpreting Results - Version Event

The first event captured is the **version** event which shows the version information as follows:

```
{ "kind": "replay", "uid": 27494, "timestamp": 1558388052211435757, "event": "version",  
  "payload": { "major": 0, "minor": 3, "patch": 3 } }
```

Each line contains the following set of common elements:

kind Always set to `replay`

uid This is the MPI rank of the process generating the event for mpi programs or the PID for non-mpi.

timestamp Set to the time when the event occurred.

event Set to one of: `version`, `makeMemoryResource`, `makeAllocator`, `allocate`, or `deallocate`

payload Optional and varies upon event type

result Optional and varies upon event type

As can be seen, the *major*, *minor*, and *patch* version numbers are captured within the *payload* for this event.

5.4.5 makeMemoryResource Event

Next you will see events for the creation of the default memory resources provided by Umpire with the **makeMemoryResource** event:

```
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052211477678, "event": 
  ↵"makeMemoryResource", "payload": { "name": "HOST" }, "result": "0x101626b0" }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052471684134, "event": 
  ↵"makeMemoryResource", "payload": { "name": "DEVICE" }, "result": "0x101d79a0" }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052471698804, "event": 
  ↵"makeMemoryResource", "payload": { "name": "PINNED" }, "result": "0x101d7a50" }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052472972935, "event": 
  ↵"makeMemoryResource", "payload": { "name": "UM" }, "result": "0x101d7b00" }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052595814979, "event": 
  ↵"makeMemoryResource", "payload": { "name": "DEVICE_CONST" }, "result": "0x101d7bb0" 
  ↵}
}
```

The *payload* shows that a memory resource was created for *HOST*, *DEVICE*, *PINNED*, *UM*, and *DEVICE_CONST* respectively. Note that this could also be done with the *FILE* memory resource. The *result* is a reference to the object that was created within Umpire for that resource.

5.4.6 makeAllocator Event

The **makeAllocator** event occurs whenever a new allocator instance is being created. Each call to *makeAllocator* will generate a pair of JSON lines. The first line will show the intent of the call and the second line will show both the intent and the result. This is because the *makeAllocator* call can fail and keeping both the intent and result allows us to reproduce this failure later.

umpire::Allocator:

```
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052595864262, "event": 
  ↵"makeAllocator", "payload": { "type": "umpire::strategy::DynamicPool", "with_ 
  ↵introspection": true, "allocator_name": "pool", "args": [ "HOST" ] } }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052595903505, "event": 
  ↵"makeAllocator", "payload": { "type": "umpire::strategy::DynamicPool", "with_ 
  ↵introspection": true, "allocator_name": "pool", "args": [ "HOST" ] }, "result": {
  ↵"allocator_ref": "0x108a8730" } }
```

The *payload* shows how the allocator was constructed. The *result* shows the reference to the allocated object.

5.4.7 allocate Event

Like the **makeAllocator** event, the **allocate** event is captured as an intention/result pair so that an error may be replayed in the event that there is an allocation failure.

```
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052595911583, "event": "allocate",
  ↵"payload": { "allocator_ref": "0x108a8730", "size": 0 } }
{
  "kind": "replay", "uid": 27494, "timestamp": 1558388052595934822, "event": "allocate",
  ↵"payload": { "allocator_ref": "0x108a8730", "size": 0 }, "result": { "memory_ptr": 
  ↵"0x200040000010" } }
```

The *payload* shows the object reference of the allocator and the size of the allocation request. The *result* shows the pointer to the memory allocated.

5.4.8 deallocate Event

```
{ "kind": "replay", "uid": 27494, "timestamp": 1558388052596358577, "event": "deallocate",  
  "payload": { "allocator_ref": "0x108a8730", "memory_ptr": "0x200040000010" } }
```

The *payload* shows the reference to the allocator object and the pointer to the allocated memory that is to be freed.

5.4.9 Replaying the session

Loading this file with the `replay` program will replay this sequence of `umpire::Allocator` creation, allocations, and deallocations:

```
./bin/replay -i replay_log.json
```

5.5 Operations

Operations provide an abstract interface to modifying and moving data between Umpire `:class: `umpire::Allocator``'s.

5.5.1 Provided Operations

```
namespace umpire::op

class CudaAdviseAccessedByOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdviseAccessedByOperation.hpp>

class CudaAdvisePreferredLocationOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdvisePreferredLocationOperation.hpp>

class CudaAdviseReadMostlyOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdviseReadMostlyOperation.hpp>

class CudaAdviseUnsetAccessedByOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdviseUnsetAccessedByOperation.hpp>

class CudaAdviseUnsetPreferredLocationOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdviseUnsetPreferredLocationOperation.hpp>

class CudaAdviseUnsetReadMostlyOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaAdviseUnsetReadMostlyOperation.hpp>

class CudaCopyFromOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaCopyFromOperation.hpp> Copy operation to move data from a NVIDIA GPU
    to CPU memory.

class CudaCopyOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaCopyOperation.hpp> Copy operation to move data between two GPU ad-
    dresses.

class CudaCopyToOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaCopyToOperation.hpp> Copy operation to move data from CPU to NVIDIA
    GPU memory.

template<cudaMemRangeAttribute ATTRIBUTE>
```

```

class CudaGetAttributeOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaGetAttributeOperation.hpp> Copy operation to move data from CPU to
    NVIDIA GPU memory.

class CudaMemPrefetchOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaMemPrefetchOperation.hpp>

class CudaMemsetOperation : public umpire::op::MemoryOperation
    #include <umpire/op/CudaMemsetOperation.hpp> Memset on NVIDIA device memory.

class GenericReallocateOperation : public umpire::op::MemoryOperation
    #include <umpire/op/GenericReallocateOperation.hpp> Generic reallocate operation to work on any cur-
    rent_ptr location.

class HipCopyFromOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HipCopyFromOperation.hpp> Copy operation to move data from a AMD GPU to
    CPU memory.

class HipCopyOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HipCopyOperation.hpp> Copy operation to move data between two GPU addresses.

class HipCopyToOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HipCopyToOperation.hpp> Copy operation to move data from CPU to AMD GPU
    memory.

class HipMemsetOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HipMemsetOperation.hpp> Memset on AMD device memory.

class HostCopyOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HostCopyOperation.hpp> Copy memory between two allocations in CPU memory.

class HostMemsetOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HostMemsetOperation.hpp> Memset an allocation in CPU memory.

class HostReallocateOperation : public umpire::op::MemoryOperation
    #include <umpire/op/HostReallocateOperation.hpp> Reallocate data in CPU memory.

class MemoryOperation
    #include <umpire/op/MemoryOperation.hpp> Base class of an operation on memory.

    Neither the transfrom or apply methods are pure virtual, so inheriting classes only need overload the
    appropriate method. However, both methods will throw an error if called.

class MemoryOperationRegistry
    #include <umpire/op/MemoryOperationRegistry.hpp> The MemoryOperationRegistry serves as a registry
    for MemoryOperation objects. It is a singleton class, typically accessed through the ResourceManager.

```

The *MemoryOperationRegistry* class provides lookup mechanisms allowing searching for the appropriate *MemoryOperation* to be applied to allocations made with particular AllocationStrategy objects.

MemoryOperations provided by Umpire are registered with the *MemoryOperationRegistry* when it is constructed. Additional MemoryOperations can be registered later using the registerOperation method.

The following operations are pre-registered for all AllocationStrategy pairs:

- "COPY"
- "MEMSET"
- "REALLOCATE"

See *MemoryOperation*

See *AllocationStrategy*

```
class NumaMoveOperation : public umpire::op::MemoryOperation

    #include <umpire/op/SyclMemsetOperation.hpp> Memset on Intel GPU device memory.
```

5.6 Strategies

Strategies are used in Umpire to allow custom algorithms to be applied when allocating memory. These strategies can do anything, from providing different pooling methods to speed up allocations to applying different operations to every allocation. Strategies can be composed to combine their functionality, allowing flexible and reusable implementations of different components.

class AllocationStrategy

AllocationStrategy provides a unified interface to all classes that can be used to allocate and free data.

Subclassed by *umpire::resource::MemoryResource*, *umpire::strategy::AlignedAllocator*,
umpire::strategy::AllocationAdvisor, *umpire::strategy::AllocationPrefetcher*, *umpire::strategy::AllocationTracker*, *umpire::strategy::DynamicPoolList*, *umpire::strategy::DynamicPoolMap*,

`umpire::strategy::FixedPool, umpire::strategy::MixedPool, umpire::strategy::MonotonicAllocationStrategy, umpire::strategy::NamedAllocationStrategy, umpire::strategy::NumaPolicy, umpire::strategy::QuickPool, umpire::strategy::SizeLimiter, umpire::strategy::SlotPool, umpire::strategy::ThreadSafeAllocator, umpire::strategy::ZeroByteHandler`

5.6.1 Provided Strategies

class AllocationAdvisor : public `umpire::strategy::AllocationStrategy`

Applies the given MemoryOperation to every allocation.

This `AllocationStrategy` is designed to be used with the following operations:

- `op::CudaAdviseAccessedByOperation`
- `op::CudaAdvisePreferredLocationOperation`
- `op::CudaAdviseReadMostlyOperation`

Using this `AllocationStrategy` when combined with a pool like DynamicPool is a good way to mitigate the overhead of applying the memory advice.

Warning: doxygenclass: Cannot find class “`umpire::strategy::DynamicPool`” in doxygen xml output for project “`umpire`” from directory: `../doxygen/xml/`

class FixedPool : public `umpire::strategy::AllocationStrategy`

Pool for fixed size allocations.

This `AllocationStrategy` provides an efficient pool for fixed size allocations, and used to quickly allocate and deallocate objects.

class MonotonicAllocationStrategy : public `umpire::strategy::AllocationStrategy`

class SlotPool : public `umpire::strategy::AllocationStrategy`

class ThreadSafeAllocator : public `umpire::strategy::AllocationStrategy`

Make an `Allocator` thread safe.

Using this `AllocationStrategy` will make the provided allocator thread-safe by syncronizing access to the allocators interface.

6.3.2 Classes and Structs

Struct DynamicSizePool::Block

- Defined in file_umpire_strategy_DynamicSizePool.hpp

Nested Relationships

This struct is a nested type of *Template Class DynamicSizePool*.

Struct Documentation

struct DynamicSizePool::**Block**

Public Members

```
char *data
std::size_t size
std::size_t blockSize
Block *next
```

Struct FixedSizePool::Pool

- Defined in file_umpire_strategy_FixedSizePool.hpp

Nested Relationships

This struct is a nested type of [Template Class FixedSizePool](#).

Struct Documentation

```
struct FixedSizePool::Pool
```

Public Members

```
unsigned char *data  
unsigned int *avail  
unsigned int numAvail  
struct Pool *next
```

Struct s_umpire_allocator

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_allocator
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_resourcemanager

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_resourcemanager
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_SHROUD_array

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_SHROUD_array
```

Public Members

```

```

Struct s_umpire_strategy_dynamicpool

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_dynamicpool
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_strategy_dynamicpoollist

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_dynamicpoollist
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_strategy_fixedpool

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_fixedpool
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_strategy_namedallocationstrategy

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_namedallocationstrategy
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_strategy_quickpool

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_quickpool
```

Public Members

```
void *addr  
int idtor
```

Struct s_umpire_strategy_threadsafeallocator

- Defined in file_umpire_interface_c_fortran_typesUmpire.h

Struct Documentation

```
struct s_umpire_strategy_threadsafeallocator
```

Public Members

```
void *addr  
int idtor
```

Struct StdAllocator

- Defined in file_umpire_strategy_StdAllocator.hpp

Struct Documentation

```
struct StdAllocator
```

Public Static Functions

```
void *allocate (std::size_t size)
void deallocate (void *ptr)
```

Struct CudaMallocAllocator

- Defined in file_umpire_alloc_CudaMallocAllocator.hpp

Struct Documentation

struct `umpire::alloc::CudaMallocAllocator`

Uses cudaMalloc and cudaFree to allocate and deallocate memory on NVIDIA GPUs.

Public Functions

```
void *allocate (std::size_t size)
    Allocate bytes of memory using cudaMalloc.
```

Return Pointer to start of the allocation.

Parameters

- bytes: Number of bytes to allocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

```
void deallocate (void *ptr)
    Deallocate memory using cudaFree.
```

Parameters

- ptr: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct CudaMallocManagedAllocator

- Defined in file_umpire_alloc_CudaMallocManagedAllocator.hpp

Struct Documentation

struct `umpire::alloc::CudaMallocManagedAllocator`

Uses `cudaMallocManaged` and `cudaFree` to allocate and deallocate unified memory on NVIDIA GPUs.

Public Functions

`void *allocate (std::size_t bytes)`

Allocate bytes of memory using `cudaMallocManaged`.

Return Pointer to start of the allocation.

Parameters

- `bytes`: Number of bytes to allocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

`void deallocate (void *ptr)`

Deallocate memory using `cudaFree`.

Parameters

- `ptr`: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory be free'd.

Struct CudaPinnedAllocator

- Defined in file `_umpire_alloc_CudaPinnedAllocator.hpp`

Struct Documentation

struct `umpire::alloc::CudaPinnedAllocator`

Public Functions

`void *allocate (std::size_t bytes)`

`void deallocate (void *ptr)`

Struct HipMallocAllocator

- Defined in file_umpire_alloc_HipMallocAllocator.hpp

Struct Documentation

struct `umpire::alloc::HipMallocAllocator`

Uses hipMalloc and hipFree to allocate and deallocate memory on AMD GPUs.

Public Functions

`void *allocate (std::size_t size)`
Allocate bytes of memory using hipMalloc.

Return Pointer to start of the allocation.

Parameters

- `bytes`: Number of bytes to allocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

`void deallocate (void *ptr)`
Deallocate memory using hipFree.

Parameters

- `ptr`: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct HipPinnedAllocator

- Defined in file_umpire_alloc_HipPinnedAllocator.hpp

Struct Documentation

struct `umpire::alloc::HipPinnedAllocator`

Public Functions

`void *allocate (std::size_t bytes)`
`void deallocate (void *ptr)`

Struct MallocAllocator

- Defined in file_umpire_alloc_MallocAllocator.hpp

Struct Documentation

struct `umpire::alloc::MallocAllocator`

Uses malloc and free to allocate and deallocate CPU memory.

Public Functions

`void *allocate (std::size_t bytes)`

Allocate bytes of memory using malloc.

Return Pointer to start of the allocation.

Parameters

- `bytes`: Number of bytes to allocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

`void deallocate (void *ptr)`

Deallocate memory using free.

Parameters

- `ptr`: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct OpenMPTargetAllocator

- Defined in file_umpire_alloc_OpenMPTargetAllocator.hpp

Struct Documentation

struct `umpire::alloc::OpenMPTargetAllocator`

Uses malloc and free to allocate and deallocate CPU memory.

Public Functions

OpenMPTargetAllocator (int *_device*)

void ***allocate** (std::size_t *bytes*)

Allocate bytes of memory using malloc.

Return Pointer to start of the allocation.

Parameters

- *bytes*: Number of bytes to allocate.

Exceptions

- *umpire::util::Exception*: if memory cannot be allocated.

void **deallocate** (void **ptr*)

Deallocate memory using free.

Parameters

- *ptr*: Address to deallocate.

Exceptions

- *umpire::util::Exception*: if memory cannot be free'd.

Public Members

int **device**

Struct PosixMemalignAllocator

- Defined in file_umpire_alloc_PosixMemalignAllocator.hpp

Struct Documentation

struct *umpire::alloc::PosixMemalignAllocator*

Uses `posix_memalign()` and `free()` to allocate page-aligned memory.

Public Functions

void ***allocate** (std::size_t *bytes*)

Allocate bytes of memory using `posix_memalign`.

Return Pointer to start of the allocation.

Parameters

- *bytes*: Number of bytes to allocate. Does not have to be a multiple of the system page size.

Exceptions

- *umpire::util::Exception*: if memory cannot be allocated.

```
void deallocate (void *ptr)
    Deallocate memory using free.
```

Parameters

- `ptr`: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct **SyclMallocAllocator**

- Defined in file_umpire_alloc_SyclMallocAllocator.hpp

Struct Documentation

```
struct umpire::alloc::SyclMallocAllocator
```

Uses sycl's malloc and free to allocate and deallocate memory on Intel GPUs.

Public Functions

```
void *allocate (std::size_t size, const cl::sycl::queue &queue_t)
    Allocate bytes of memory using SYCL malloc
```

Return Pointer to start of the allocation on device.

Parameters

- `size`: Number of bytes to allocate.
- `queue_t`: SYCL queue for providing information on device and context

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

```
void deallocate (void *ptr, const cl::sycl::queue &queue_t)
    Deallocate memory using SYCL free.
```

Parameters

- `ptr`: Address to deallocate.
- `queue_t`: SYCL queue this pointer was associated with

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct **SyclMallocManagedAllocator**

- Defined in file_umpire_alloc_SyclMallocManagedAllocator.hpp

Struct Documentation

struct `umpire::alloc::SyclMallocManagedAllocator`

Uses `sycl_shared` and `sycl_free` to allocate and deallocate unified shared memory (USM) on Intel GPUs.

Public Functions

`void *allocate (std::size_t bytes, const cl::sycl::queue &queue_t)`
Allocate bytes of memory using `cl::sycl::malloc_shared`.

Return Pointer to start of the allocation.

Parameters

- `bytes`: Number of bytes to allocate.

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

`void deallocate (void *usm_ptr, const cl::sycl::queue &queue_t)`
Deallocate memory using `cl::sycl::free`.

Parameters

- `usm_ptr`: Address to deallocate.

Exceptions

- `umpire::util::Exception`: if memory be free'd.

Struct **SyclPinnedAllocator**

- Defined in file_umpire_alloc_SyclPinnedAllocator.hpp

Struct Documentation

struct `umpire::alloc::SyclPinnedAllocator`

Uses `sycl's malloc_host` and `free` to allocate and deallocate pinned memory on host.

Public Functions

```
void *allocate (std::size_t size, const cl::sycl::queue &queue_t)
    Allocate bytes of memory using SYCL malloc_host
```

Return Pointer to start of the allocation on host.

Parameters

- `size`: Number of bytes to allocate.
- `queue_t`: SYCL queue for providing information on device and context

Exceptions

- `umpire::util::Exception`: if memory cannot be allocated.

```
void deallocate (void *ptr, const cl::sycl::queue &queue_t)
    Deallocate memory using SYCL free.
```

Parameters

- `ptr`: Address to deallocate.
- `queue_t`: SYCL queue this pointer was associated with

Exceptions

- `umpire::util::Exception`: if memory cannot be free'd.

Struct MemoryResourceTraits

- Defined in file_umpire_util_MemoryResourceTraits.hpp

Struct Documentation

```
struct umpire::MemoryResourceTraits
```

Public Types

```
enum optimized_for
    Values:
        enumerator any
        enumerator latency
        enumerator bandwidth
        enumerator access

enum vendor_type
    Values:
        enumerator unknown
        enumerator amd
        enumerator ibm
```

```
enumerator intel
enumerator nvidia

enum memory_type
Values:
enumerator unknown
enumerator ddr
enumerator gddr
enumerator hbm
enumerator nvme

enum resource_type
Values:
enumerator unknown
enumerator host
enumerator device
enumerator device_const
enumerator pinned
enumerator um
enumerator file
```

Public Members

```
int id
bool unified = false
std::size_t size = 0
vendor_type vendor = vendor_type::unknown
memory_type kind = memory_type::unknown
optimized_for used_for = optimized_for::any
resource_type resource = resource_type::unknown
```

Struct pair_hash

- Defined in file_umpire_op_MemoryOperationRegistry.hpp

Struct Documentation

```
struct umpire::op::pair_hash
```

Public Functions

```
std::size_t operator() (const std::pair<Platform, Platform> &p) const noexcept
```

Struct MemoryResourceTypeHash

- Defined in file_umpire_resource_MemoryResourceTypes.hpp

Struct Documentation

```
struct umpire::resource::MemoryResourceTypeHash
```

Public Functions

```
template<typename T>
std::size_t operator() (T t) const noexcept
```

Struct FixedPool::Pool

- Defined in file_umpire_strategy_FixedPool.hpp

Nested Relationships

This struct is a nested type of *Class FixedPool*.

Struct Documentation

```
struct umpire::strategy::FixedPool::Pool
```

Public Functions

```
Pool (AllocationStrategy *allocation_strategy, const std::size_t object_bytes, const std::size_t objects_per_pool, const std::size_t avail_bytes)
```

Public Members

```
AllocationStrategy *strategy  
char *data  
int *avail  
std::size_t num_avail
```

Struct QuickPool::Chunk

- Defined in file_umpire_strategy_QuickPool.hpp

Nested Relationships

This struct is a nested type of [Class QuickPool](#).

Struct Documentation

```
struct umpire::strategy::QuickPool::Chunk
```

Public Functions

```
Chunk(void *ptr, std::size_t s, std::size_t cs)
```

Public Members

```
void *data = {nullptr}  
std::size_t size = {0}  
std::size_t chunk_size = {0}  
bool free = {true}  
Chunk *prev = {nullptr}  
Chunk *next = {nullptr}  
SizeMap::iterator size_map_it
```

Template Struct RecordList::Block

- Defined in file_umpire_util_AllocationMap.hpp

Nested Relationships

This struct is a nested type of `Class AllocationMap::RecordList`.

Struct Documentation

```
template<typename T>
struct umpire::util::AllocationMap::RecordList::Block
```

Public Members

```
T rec
Block *prev
```

Struct AllocationRecord

- Defined in file_umpire_util_AllocationRecord.hpp

Struct Documentation

```
struct umpire::util::AllocationRecord
```

Public Functions

```
AllocationRecord(void *p, std::size_t s, strategy::AllocationStrategy *strat)
AllocationRecord()
```

Public Members

```
void *ptr
std::size_t size
strategy::AllocationStrategy *strategy
util::backtrace allocation_backtrace
```

Struct backtrace

- Defined in file_umpire_util_backtrace.hpp

Struct Documentation

```
struct umpire::util::backtrace
```

Public Members

```
std::vector<void*> frames
```

Template Struct backtracer

- Defined in file_umpire_util_backtrace.hpp

Struct Documentation

```
template<typename TraceType = trace_optional>
struct backtracer
```

Template Struct backtracer< trace_always >

- Defined in file_umpire_util_backtrace.inl

Struct Documentation

```
template<>
struct umpire::util::backtracer<trace_always>
```

Public Static Functions

```
void get_backtrace(backtrace &bt)
std::string print(const backtrace &bt)
```

Template Struct backtracer< trace_optional >

- Defined in file_umpire_util_backtrace.inl

Struct Documentation

```
template<>
struct umpire::util::backtracer<trace_optional>
```

Public Static Functions

```
void get_backtrace (backtrace &bt)
std::string print (const backtrace &bt)
```

Struct FixedMAllocPool::Pool

- Defined in file_umpire_util_FixedMAllocPool.hpp

Nested Relationships

This struct is a nested type of *Class FixedMAllocPool*.

Struct Documentation

```
struct umpire::util::FixedMAllocPool::Pool
```

Public Functions

```
Pool (const std::size_t object_bytes, const std::size_t objects_per_pool)
```

Public Members

```
unsigned char *data
unsigned char *next
unsigned int num_initialized
std::size_t num_free
```

Struct iterator_begin

- Defined in file_umpire_util_MemoryMap.hpp

Struct Documentation

```
struct iterator_begin
```

Struct iterator_end

- Defined in file_umpire_util_MemoryMap.hpp

Struct Documentation

```
struct iterator_end
```

Struct trace_always

- Defined in file_umpire_util_backtrace.hpp

Struct Documentation

```
struct trace_always
```

Struct trace_optional

- Defined in file_umpire_util_backtrace.hpp

Struct Documentation

```
struct trace_optional
```

Template Class DynamicSizePool

- Defined in file_umpire_strategy_DynamicSizePool.hpp

Nested Relationships

Nested Types

- Struct DynamicSizePool::Block*

Inheritance Relationships

Base Type

- private umpire::strategy::mixins::AlignedAllocation (*Class AlignedAllocation*)

Class Documentation

```
template<class IA = StdAllocator>
class DynamicSizePool : private umpire::strategy::mixins::AlignedAllocation
```

Public Functions

```
DynamicSizePool(umpire::strategy::AllocationStrategy *strat, const std::size_t
                 first_minimum_pool_allocation_size = (16 * 1024), const std::size_t
                 next_minimum_pool_allocation_size = 256, const std::size_t alignment =
                 16)
DynamicSizePool(const DynamicSizePool&) = delete
~DynamicSizePool()
void *allocate(std::size_t bytes)
void deallocate(void *ptr)
void release()
std::size_t getActualSize() const
std::size_t getCurrentSize() const
std::size_t getBlocksInPool() const
std::size_t getLargestAvailableBlock() const
std::size_t getReleasableSize() const
std::size_t getFreeBlocks() const
std::size_t getInUseBlocks() const
void coalesce()
```

Protected Types

```
typedef FixedSizePool<struct Block, IA, IA, (1 << 6)> BlockPool
```

Protected Functions

```
void findUsableBlock(struct Block *&best, struct Block *&prev, std::size_t size)
void allocateBlock(struct Block *&curr, struct Block *&prev, std::size_t size)
void splitBlock(struct Block *&curr, struct Block *&prev, const std::size_t size)
void releaseBlock(struct Block *curr, struct Block *prev)
std::size_t freeReleasedBlocks()
void coalesceFreeBlocks(std::size_t size)
```

Protected Attributes

```
BlockPool blockPool
struct Block *usedBlocks
struct Block *freeBlocks
std::size_t m_actual_bytes
std::size_t m_current_size = {0}
std::size_t m_first_minimum_pool_allocation_size
std::size_t m_next_minimum_pool_allocation_size
bool m_is_destructing = {false}
```

Private Functions

```
std::size_t aligned_round_up (std::size_t size)
    Round up the size to be an integral multiple of configured alignment.
```

Return Size rounded up to be integral multiple of configured alignment

```
void *aligned_allocate (const std::size_t size)
    Return an allocation of size bytes that is aligned on the configured alignment boundary.
```

```
void aligned_deallocate (void *ptr)
    Deallocate previously aligned allocation.
```

Private Members

```
strategy::AllocationStrategy *m_allocator
struct Block
```

Public Members

```
char *data
std::size_t size
std::size_t blockSize
Block *next
```

Template Class **FixedSizePool**

- Defined in file_umpire_strategy_FixedSizePool.hpp

Nested Relationships

Nested Types

- *Struct FixedSizePool::Pool*

Class Documentation

```
template<class T, class MA, class IA = StdAllocator, int NP = (1 << 6)>
class FixedSizePool
```

Public Functions

```
FixedSizePool()
~FixedSizePool()
T *allocate()
void deallocate (T *ptr)
std::size_t getCurrentSize () const
    Return allocated size to user.
std::size_t getActualSize () const
    Return total size with internal overhead.
std::size_t numPools () const
    Return the number of pools.
std::size_t poolSize () const
    Return the pool size.
```

Public Static Functions

```
FixedSizePool &getInstance ()
```

Protected Functions

```
void newPool (struct Pool **pnew)
T *allocInPool (struct Pool *p)
```

Protected Attributes

```
struct Pool *pool
const std::size_t numPerPool
const std::size_t totalPoolSize
std::size_t numBlocks
struct Pool
```

Public Members

```
unsigned char *data  
unsigned int *avail  
unsigned int numAvail  
struct Pool *next
```

Class Allocator

- Defined in file_umpire_Allocator.hpp

Class Documentation

```
class umpire::Allocator
```

Provides a unified interface to allocate and free data.

An *Allocator* encapsulates all the details of how and where allocations will be made, and can also be used to introspect the memory resource. *Allocator* objects do not return typed allocations, so the pointer returned from the allocate method must be cast to the relevant type.

See [TypedAllocator](#)

Public Functions

```
void *allocate (std::size_t bytes)
```

Allocate bytes of memory.

The memory will be allocated as determined by the AllocationStrategy used by this *Allocator*. Note that this method does not guarantee new memory pages being requested from the underlying memory system, as the associated AllocationStrategy could have already allocated sufficient memory, or re-use existing allocations that were not returned to the system.

Return Pointer to start of the allocation.

Parameters

- bytes: Number of bytes to allocate (≥ 0)

```
void deallocate (void *ptr)
```

Free the memory at ptr.

This method will throw an `umpire::Exception` if ptr was not allocated using this *Allocator*. If you need to deallocate memory allocated by an unknown object, use the `ResourceManager::deallocate` method.

Parameters

- ptr: Pointer to free (!nullptr)

```
void release ()
```

Release any and all unused memory held by this *Allocator*.

```
std::size_t getSize (void *ptr) const
```

Return number of bytes allocated for allocation.

Return number of bytes allocated for ptr

Parameters

- `ptr`: Pointer to allocation in question

`std::size_t getHighWatermark() const noexcept`

Return the memory high watermark for this *Allocator*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by `getCurrentSize()`.

Return Memory high watermark.

`std::size_t getCurrentSize() const noexcept`

Return the current size of this *Allocator*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark()`.

Return current size of *Allocator*.

`std::size_t getActualSize() const noexcept`

Return the actual size of this *Allocator*.

For non-pool allocators, this will be the same as `getCurrentSize()`.

For pools, this is the total amount of memory allocated for blocks managed by the pool.

Return actual size of *Allocator*.

`std::size_t getAllocationCount() const noexcept`

Return the number of active allocations.

`const std::string &getName() const noexcept`

Get the name of this *Allocator*.

Allocators are uniquely named, and the name of the *Allocator* can be used to retrieve the same *Allocator* from the *ResourceManager* at a later time.

See `ResourceManager::getAllocator`

Return name of *Allocator*.

`int getId() const noexcept`

Get the integer ID of this *Allocator*.

Allocators are uniquely identified, and the ID of the *Allocator* can be used to retrieve the same *Allocator* from the *ResourceManager* at a later time.

See `ResourceManager::getAllocator`

Return integer id of *Allocator*.

`strategy::AllocationStrategy *getParent() const noexcept`

`strategy::AllocationStrategy *getAllocationStrategy() noexcept`

Get the *AllocationStrategy* object used by this *Allocator*.

Return Pointer to the *AllocationStrategy*.

```
Platform getPlatform() noexcept
```

Get the Platform object appropriate for this *Allocator*.

Return Platform for this *Allocator*.

```
Allocator() = default
```

Friends

```
friend class ::AllocatorTest
```

```
friend std::ostream &operator<< (std::ostream&, const Allocator&)
```

Class DeviceAllocator

- Defined in file_umpire_DeviceAllocator.hpp

Class Documentation

```
class umpire::DeviceAllocator
```

Lightweight allocator for use in GPU code.

Public Functions

```
__host__ DeviceAllocator(Allocator allocator, size_t size)
```

Construct a new *DeviceAllocator* that will use allocator to allocate data.

Parameters

- allocator: *Allocator* to use for allocating memory.

```
__host__ ~DeviceAllocator()
```

```
__host__ __device__ DeviceAllocator(const DeviceAllocator &other)
```

```
__device__ void * allocate(size_t size)
```

Class CudaAdviseAccessedByOperation

- Defined in file_umpire_op_CudaAdviseAccessedByOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaAdviseAccessedByOperation : public umpire::op::MemoryOperation
```

Public Functions

void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
 Apply val to the first length bytes of src_ptr.

Uses cudaMemAdvise to set data as accessed by the appropriate device.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length)
 Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

camp::resources::Event **transform_async** (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)

camp::resources::Event **apply_async** (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length, camp::resources::Resource &ctx)

Class CudaAdvisePreferredLocationOperation

- Defined in file_umpire_op_CudaAdvisePreferredLocationOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaAdvisePreferredLocationOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
```

Apply val to the first length bytes of src_ptr.

Uses cudaMemAdvise to set prefferred location of data.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception:

```
void transform(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
              util::AllocationRecord *dst_allocation, std::size_t length)
```

Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception:

```
camp::resources::Event transform_async(void *src_ptr, void **dst_ptr, util::AllocationRecord
                                      *src_allocation, util::AllocationRecord *dst_allocation,
                                      std::size_t length, camp::resources::Resource &ctx)
```

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class CudaAdviseReadMostlyOperation

- Defined in file_umpire_op_CudaAdviseReadMostlyOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaAdviseReadMostlyOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Uses cudaMemAdvise to set data as “read mostly” on the appropriate device.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception*:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
                util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatino memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length, camp::resources::Resource &ctx)
```

Class CudaAdviseUnsetAccessedByOperation

- Defined in file_umpire_op_CudaAdviseUnsetAccessedByOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaAdviseUnsetAccessedByOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
    Uses cudaMemAdvise to set data as accessed by the appropriate device.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception*:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)

camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class CudaAdviseUnsetPreferredLocationOperation

- Defined in file_umpire_op_CudaAdviseUnsetPreferredLocationOperation.hpp

Inheritance Relationships

Base Type

- `public umpire::op::MemoryOperation (Class MemoryOperation)`

Class Documentation

```
class umpire::op::CudaAdviseUnsetPreferredLocationOperation : public umpire::op::MemoryOperation
```

Public Functions

`void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)`
 Apply val to the first length bytes of src_ptr.

Uses cudaMemAdvise to set preferred location of data.

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

`void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
 util::AllocationRecord *dst_allocation, std::size_t length)`
 Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatio memory location.
- `src_allocation`: AllocationRecord of source.

- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)  
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class CudaAdviseUnsetReadMostlyOperation

- Defined in file_umpire_op_CudaAdviseUnsetReadMostlyOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaAdviseUnsetReadMostlyOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.  
Uses cudaMemAdvise to set data as “read mostly” on the appropriate device.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
util::AllocationRecord *dst_allocation, std::size_t length)  
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.

- dst_ptr: Pointer to destination memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)

camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class CudaCopyFromOperation

- Defined in file_umpire_op_CudaCopyFromOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

class `umpire::op::CudaCopyFromOperation : public umpire::op::MemoryOperation`
 Copy operation to move data from a NVIDIA GPU to CPU memory.

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
               util::AllocationRecord *dst_allocation, std::size_t length)
  Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses cudaMemcpy to move data when src_ptr is on a NVIDIA GPU and dst_ptr is on the CPU.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destination memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)

void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                         std::size_t length, camp::resources::Resource &ctx)
```

Class CudaCopyOperation

- Defined in file_umpire_op_CudaCopyOperation.hpp

Inheritance Relationships

Base Type

- `public umpire::op::MemoryOperation (Class MemoryOperation)`

Class Documentation

```
class umpire::op::CudaCopyOperation : public umpire::op::MemoryOperation
Copy operation to move data between two GPU addresses.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-
                  pire::util::AllocationRecord *dst_allocation, std::size_t length)
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses cudaMemcpy to move data when both src_ptr and dst_ptr are on NVIDIA GPUs.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.

- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class CudaCopyToOperation

- Defined in file_umpire_op_CudaCopyToOperation.hpp

Inheritance Relationships

Base Type

- `public umpire::op::MemoryOperation (Class MemoryOperation)`

Class Documentation

```
class umpire::op::CudaCopyToOperation : public umpire::op::MemoryOperation
Copy operation to move data from CPU to NVIDIA GPU memory.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-
                pire::util::AllocationRecord *dst_allocation, std::size_t length)
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses cudaMemcpy to move data when src_ptr is on the CPU and dst_ptr is on an NVIDIA GPU.

Parameters

- `src_ptr`: Pointer to source memory location.

- dst_ptr: Pointer to destination memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, um-
                                         pire::util::AllocationRecord *src_allocation, um-
                                         pire::util::AllocationRecord *dst_allocation, std::size_t
                                         length, camp::resources::Resource &ctx)

void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Template Class CudaGetAttributeOperation

- Defined in file_umpire_op_CudaGetAttributeOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
template<cudaMemRangeAttribute ATTRIBUTE>
class umpire::op::CudaGetAttributeOperation : public umpire::op::MemoryOperation
    Copy operation to move data from CPU to NVIDIA GPU memory.
```

Public Functions

```
bool check_apply(void *src_ptr, umpire::util::AllocationRecord *src_allocation, int val, std::size_t length) override
```

Uses cudaMemRangeGetAttribute to check attributes of a CUDA memory range.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destination memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
void transform(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length)
```

Transfrom length bytes of memory from `src_ptr` to `dst_ptr`.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destination memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)
```

```
void apply(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
```

Apply `val` to the first `length` bytes of `src_ptr`.

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length, camp::resources::Resource &ctx)
```

Class CudaMemPrefetchOperation

- Defined in file_umpire_op_CudaMemPrefetchOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaMemPrefetchOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply(void *src_ptr, umpire::util::AllocationRecord *src_allocation, int value, std::size_t length)  
    Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception*:

```
void transform(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
             util::AllocationRecord *dst_allocation, std::size_t length)  
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception*:

```
camp::resources::Event transform_async(void *src_ptr, void **dst_ptr, util::AllocationRecord  
                                      *src_allocation, util::AllocationRecord *dst_allocation,  
                                      std::size_t length, camp::resources::Resource &ctx)
```

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class CudaMemsetOperation

- Defined in file_umpire_op_CudaMemsetOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::CudaMemsetOperation : public umpire::op::MemoryOperation
Memset on NVIDIA device memory.
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *ptr, int value, std::size_t length)
Apply val to the first length bytes of src_ptr.
```

Uses cudaMemset to set first length bytes of src_ptr to value.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *ptr, int value, std::size_t
                                    length, camp::resources::Resource &ctx)
```

```
void transform (void    *src_ptr,    void    **dst_ptr,    util::AllocationRecord    *src_allocation,
                util::AllocationRecord *dst_allocation, std::size_t length)
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatino memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

Class GenericReallocateOperation

- Defined in file_umpire_op_GenericReallocateOperation.hpp

Inheritance Relationships

Base Type

- public `umpire::op::MemoryOperation` (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::GenericReallocateOperation : public umpire::op::MemoryOperation  
Generic reallocate operation to work on any current_ptr location.
```

Public Functions

```
void transform (void *current_ptr, void **new_ptr, util::AllocationRecord *current_allocation,  
util::AllocationRecord *new_allocation, std::size_t new_size)  
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

This operation relies on `ResourceManager::copy`, `AllocationStrategy::allocate` and `AllocationStrategy::deallocate` to implement a reallocate operation that can work for any current_ptr location.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatio memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class HipCopyFromOperation

- Defined in file_umpire_op_HipCopyFromOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HipCopyFromOperation : public umpire::op::MemoryOperation  
Copy operation to move data from a AMD GPU to CPU memory.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
util::AllocationRecord *dst_allocation, std::size_t length)  
Transfrom length bytes of memory from src_ptr to dst_ptr.  
Uses hipMemcpy to move data when src_ptr is on a AMD GPU and dst_ptr is on the CPU.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class HipCopyOperation

- Defined in file_umpire_op_HipCopyOperation.hpp

Inheritance Relationships

Base Type

- `public umpire::op::MemoryOperation (Class MemoryOperation)`

Class Documentation

```
class umpire::op::HipCopyOperation : public umpire::op::MemoryOperation
    Copy operation to move data between two GPU addresses.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-
                  pire::util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses hipMemcpy to move data when both src_ptr and dst_ptr are on AMD GPUs.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
```

Apply val to the first length bytes of src_ptr.

Parameters

- **src_ptr**: Pointer to source memory location.
- **src_allocation**: AllocationRecord of source.
- **val**: Value to apply.
- **length**: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                         std::size_t length, camp::resources::Resource &ctx)
```

Class HipCopyToOperation

- Defined in file_umpire_op_HipCopyToOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HipCopyToOperation : public umpire::op::MemoryOperation
Copy operation to move data from CPU to AMD GPU memory.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-
                pire::util::AllocationRecord *dst_allocation, std::size_t length)
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses hipMemcpy to move data when src_ptr is on the CPU and dst_ptr is on an AMD GPU.

Parameters

- **src_ptr**: Pointer to source memory location.
- **dst_ptr**: Pointer to destinatio memory location.
- **src_allocation**: AllocationRecord of source.

- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class HipMemsetOperation

- Defined in file_umpire_op_HipMemsetOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HipMemsetOperation : public umpire::op::MemoryOperation  
Memset on AMD device memory.
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *ptr, int value, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Uses hipMemset to set first length bytes of src_ptr to value.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
               util::AllocationRecord *dst_allocation, std::size_t length)
```

Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)
```

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class HostCopyOperation

- Defined in file_umpire_op_HostCopyOperation.hpp

Inheritance Relationships

Base Type

- public `umpire::op::MemoryOperation` (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HostCopyOperation : public umpire::op::MemoryOperation
    Copy memory between two allocations in CPU memory.
```

Public Functions

```
void transform(void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, umpire::util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatio memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)
```

```
void apply(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length, camp::resources::Resource &ctx)
```

Class HostMemsetOperation

- Defined in file_umpire_op_HostMemsetOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HostMemsetOperation : public umpire::op::MemoryOperation
    Memset an allocation in CPU memory.
```

Public Functions

void apply (void *src_ptr, util::AllocationRecord *allocation, int value, std::size_t length)

Apply val to the first length bytes of src_ptr.

Uses std::memset to set the first length bytes of src_ptr to value.

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- util::Exception:

void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,

util::AllocationRecord *dst_allocation, std::size_t length)

Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)  
  
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class HostReallocateOperation

- Defined in file_umpire_op_HostReallocateOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::HostReallocateOperation : public umpire::op::MemoryOperation  
Reallocate data in CPU memory.
```

Public Functions

```
void transform (void *current_ptr, void **new_ptr, util::AllocationRecord *current_allocation,  
util::AllocationRecord *new_allocation, std::size_t new_size)  
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses POSIX realloc to reallocate memory in the CPU memory.

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.

- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class MemoryOperation

- Defined in file_umpire_op_MemoryOperation.hpp

Class Documentation

class `umpire::op::MemoryOperation`
Base class of an operation on memory.

Neither the transfrom or apply methods are pure virtual, so inheriting classes only need overload the appropriate method. However, both methods will throw an error if called.

Subclassed by `umpire::op::CudaAdviseAccessedByOperation`, `umpire::op::CudaAdvisePreferredLocationOperation`, `umpire::op::CudaAdviseReadMostlyOperation`, `umpire::op::CudaAdviseUnsetAccessedByOperation`, `umpire::op::CudaAdviseUnsetPreferredLocationOperation`, `umpire::op::CudaAdviseUnsetReadMostlyOperation`, `umpire::op::CudaCopyFromOperation`, `umpire::op::CudaCopyOperation`, `umpire::op::CudaCopyToOperation`, `umpire::op::CudaGetAttributeOperation< ATTRIBUTE >`, `umpire::op::CudaMemPrefetchOperation`, `umpire::op::CudaMemsetOperation`, `umpire::op::GenericReallocateOperation`, `umpire::op::HipCopyFromOperation`, `umpire::op::HipCopyOperation`, `umpire::op::HipCopyToOperation`, `umpire::op::HipMemsetOperation`, `umpire::op::HostCopyOperation`, `umpire::op::HostMemsetOperation`, `umpire::op::HostReallocateOperation`, `umpire::op::NumaMoveOperation`, `umpire::op::OpenMPTargetCopyOperation`, `umpire::op::OpenMPTargetMemsetOperation`, `umpire::op::SyclCopyFromOperation`, `umpire::op::SyclCopyOperation`, `umpire::op::SyclCopyToOperation`, `umpire::op::SyclMemPrefetchOperation`, `umpire::op::SyclMemsetOperation`

Public Functions

`~MemoryOperation()` = default
`void transform(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length)`
Transfrom length bytes of memory from src_ptr to dst_ptr.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.

- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class MemoryOperationRegistry

- Defined in file `umpire_op_MemoryOperationRegistry.hpp`

Class Documentation

class `umpire::op::MemoryOperationRegistry`

The `MemoryOperationRegistry` serves as a registry for `MemoryOperation` objects. It is a singleton class, typically accessed through the `ResourceManager`.

The `MemoryOperationRegistry` class provides lookup mechanisms allowing searching for the appropriate `MemoryOperation` to be applied to allocations made with particular `AllocationStrategy` objects.

MemoryOperations provided by Umpire are registered with the `MemoryOperationRegistry` when it is constructed. Additional MemoryOperations can be registered later using the `registerOperation` method.

The following operations are pre-registered for all `AllocationStrategy` pairs:

- "COPY"
- "MEMSET"
- "REALLOCATE"

See `MemoryOperation`

See `AllocationStrategy`

Public Functions

```
std::shared_ptr<umpire::op::MemoryOperation> find(const std::string &name, strategy::AllocationStrategy *source_allocator, strategy::AllocationStrategy *dst_allocator)
```

Function to find a *MemoryOperation* object.

Finds the *MemoryOperation* object that matches the given name and AllocationStrategy objects. If the requested *MemoryOperation* is not found, this method will throw an Exception.

Parameters

- name: Name of operation.
- src_allocator: AllocationStrategy of the source allocation.
- dst_allocator: AllocationStrategy of the destination allocation.

Exceptions

- *umpire::util::Exception*: if the requested *MemoryOperation* is not found.

```
std::shared_ptr<umpire::op::MemoryOperation> find(const std::string &name, std::pair<Platform, Platform
```

```
void registerOperation(const std::string &name, std::pair<Platform, PlatformMemoryOperation> &&operation) noexcept
```

Add a new *MemoryOperation* to the registry.

This object will register the provided *MemoryOperation*, making it available for later retrieval using *MemoryOperation*::find

Parameters

- name: Name of the operation.
- platforms: pair of Platforms for the source and destination.
- operation: pointer to the *MemoryOperation*.

```
MemoryOperationRegistry(const MemoryOperationRegistry&) = delete
```

```
MemoryOperationRegistry &operator=(const MemoryOperationRegistry&) = delete
```

```
~MemoryOperationRegistry() = default
```

Public Static Functions

```
MemoryOperationRegistry &getInstance() noexcept
```

Get the *MemoryOperationRegistry* singleton instance.

Protected Functions

```
MemoryOperationRegistry() noexcept
```

Class NumaMoveOperation

- Defined in file_umpire_op_NumaMoveOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::NumaMoveOperation : public umpire::op::MemoryOperation
    Relocate a pointer to a different NUMA node.
```

Public Functions

```
void transform(void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, umpire::util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatio memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- util::Exception*:

```
camp::resources::Event transform_async(void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation, util::AllocationRecord *dst_allocation, std::size_t length, camp::resources::Resource &ctx)
```

```
void apply(void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class OpenMPTargetCopyOperation

- Defined in file_umpire_op_OpenMPTargetCopyOperation.hpp

Inheritance Relationships

Base Type

- public `umpire::op::MemoryOperation` (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::OpenMPTargetCopyOperation : public umpire::op::MemoryOperation
```

Public Functions

`OpenMPTargetCopyOperation()` = default

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-  
pire::util::AllocationRecord *dst_allocation, std::size_t length)  
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.

- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class OpenMPTargetMemsetOperation

- Defined in file_umpire_op_OpenMPTargetMemsetOperation.hpp

Inheritance Relationships

Base Type

- public `umpire::op::MemoryOperation` (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::OpenMPTargetMemsetOperation : public umpire::op::MemoryOperation
```

Public Functions

`void apply (void *src_ptr, umpire::util::AllocationRecord *src_allocation, int value, std::size_t length)`
 Apply val to the first length bytes of src_ptr.

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
                util::AllocationRecord *dst_allocation, std::size_t length)  

  Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatio memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.

- **length:** Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)  
  
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class **SyclCopyFromOperation**

- Defined in file_umpire_op_SyclCopyFromOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::SyclCopyFromOperation : public umpire::op::MemoryOperation  
Copy operation to move data between a Intel GPU and CPU memory.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
util::AllocationRecord *dst_allocation, std::size_t length)  
Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses SYCL memcpy to move data when src_ptr is on Intel GPU and dst_ptr is on CPU

Parameters

- **src_ptr:** Pointer to source memory location.
- **dst_ptr:** Pointer to destinatino memory location.
- **src_allocation:** AllocationRecord of source.
- **dst_allocation:** AllocationRecord of destination.
- **length:** Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                    std::size_t length, camp::resources::Resource &ctx)
```

Class `SyclCopyOperation`

- Defined in file_umpire_op_SyclCopyOperation.hpp

Inheritance Relationships

Base Type

- `public umpire::op::MemoryOperation (Class MemoryOperation)`

Class Documentation

```
class umpire::op::SyclCopyOperation : public umpire::op::MemoryOperation
    Copy operation to move data between two GPU addresses.
```

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, umpire::util::AllocationRecord *src_allocation, um-
                pire::util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Uses DPCPP's USM memcpy to move data when both src_ptr and dst_ptr are on Intel GPUs.

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatino memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)
```

Apply val to the first length bytes of src_ptr.

Parameters

- **src_ptr**: Pointer to source memory location.
- **src_allocation**: AllocationRecord of source.
- **val**: Value to apply.
- **length**: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class **SyclCopyToOperation**

- Defined in file_umpire_op_SyclCopyToOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::SyclCopyToOperation : public umpire::op::MemoryOperation
```

Copy operation to move data between a Intel GPU and CPU memory.

Public Functions

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,  
util::AllocationRecord *dst_allocation, std::size_t length)
```

Transfrom length bytes of memory from src_ptr to dst_ptr.

Uses SYCL memcpy to move data when src_ptr on CPU to dst_ptr on Intel GPU

Parameters

- **src_ptr**: Pointer to source memory location.
- **dst_ptr**: Pointer to destinatio memory location.
- **src_allocation**: AllocationRecord of source.

- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- *util::Exception*:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord  
*src_allocation, util::AllocationRecord *dst_allocation,  
std::size_t length, camp::resources::Resource &ctx)
```

```
void apply (void *src_ptr, util::AllocationRecord *src_allocation, int val, std::size_t length)  
Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- *util::Exception*:

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,  
std::size_t length, camp::resources::Resource &ctx)
```

Class SyclMemPrefetchOperation

- Defined in file_umpire_op_SyclMemPrefetchOperation.hpp

Inheritance Relationships

Base Type

- public umpire::op::MemoryOperation (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::SyclMemPrefetchOperation : public umpire::op::MemoryOperation
```

Public Functions

```
void apply (void *src_ptr, umpire::util::AllocationRecord *src_allocation, int value, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- src_allocation: AllocationRecord of source.
- val: Value to apply.
- length: Number of bytes to modify.

Exceptions

- [util::Exception](#):

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
                util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- src_ptr: Pointer to source memory location.
- dst_ptr: Pointer to destinatino memory location.
- src_allocation: AllocationRecord of source.
- dst_allocation: AllocationRecord of destination.
- length: Number of bytes to transform.

Exceptions

- [util::Exception](#):

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
                                         *src_allocation, util::AllocationRecord *dst_allocation,
                                         std::size_t length, camp::resources::Resource &ctx)
```

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
                                         std::size_t length, camp::resources::Resource &ctx)
```

Class [SyclMemsetOperation](#)

- Defined in file_umpire_op_SyclMemsetOperation.hpp

Inheritance Relationships

Base Type

- public `umpire::op::MemoryOperation` (*Class MemoryOperation*)

Class Documentation

```
class umpire::op::SyclMemsetOperation : public umpire::op::MemoryOperation
    Memset on Intel GPU device memory.
```

Public Functions

```
void apply (void *src_ptr, util::AllocationRecord *ptr, int value, std::size_t length)
    Apply val to the first length bytes of src_ptr.
```

Uses SYCL memset to set first length bytes of `src_ptr` to value.

Parameters

- `src_ptr`: Pointer to source memory location.
- `src_allocation`: AllocationRecord of source.
- `val`: Value to apply.
- `length`: Number of bytes to modify.

Exceptions

- `util::Exception`:

```
void transform (void *src_ptr, void **dst_ptr, util::AllocationRecord *src_allocation,
    util::AllocationRecord *dst_allocation, std::size_t length)
    Transfrom length bytes of memory from src_ptr to dst_ptr.
```

Parameters

- `src_ptr`: Pointer to source memory location.
- `dst_ptr`: Pointer to destinatio memory location.
- `src_allocation`: AllocationRecord of source.
- `dst_allocation`: AllocationRecord of destination.
- `length`: Number of bytes to transform.

Exceptions

- `util::Exception`:

```
camp::resources::Event transform_async (void *src_ptr, void **dst_ptr, util::AllocationRecord
    *src_allocation, util::AllocationRecord *dst_allocation,
    std::size_t length, camp::resources::Resource &ctx)
```

```
camp::resources::Event apply_async (void *src_ptr, util::AllocationRecord *src_allocation, int val,
    std::size_t length, camp::resources::Resource &ctx)
```

Class Replay

- Defined in file_umpire_Replay.hpp

Class Documentation

```
class umpire::Replay
```

Public Functions

```
void logMessage (const std::string &message)
bool replayLoggingEnabled()
uint64_t replayUid()
```

Public Static Functions

```
Replay *getReplayLogger()
std::string printReplayAllocator (void)
template<typename T, typename ...Args>
std::string printReplayAllocator (T &&firstArg, Args&&... args)
```

Class CudaConstantMemoryResource

- Defined in file_umpire_resource_CudaConstantMemoryResource.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResource (*Class MemoryResource*)

Class Documentation

```
class umpire::resource::CudaConstantMemoryResource : public umpire::resource::MemoryResource
```

Public Functions

```
CudaConstantMemoryResource (const std::string &name, int id, MemoryResourceTraits traits)
void *allocate (std::size_t bytes)
Allocate bytes of memory.
```

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- `bytes`: Number of bytes to allocate.

```
void deallocate (void *ptr)  
    Free the memory at ptr.
```

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- `ptr`: Pointer to free.

```
std::size_t getCurrentSize () const noexcept  
    Return the current size of this MemoryResource.
```

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark`.

Return current total size of active allocations in this *MemoryResource*.

```
std::size_t getHighWatermark () const noexcept  
    Return the memory high watermark for this MemoryResource.
```

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by `getCurrentSize`.

Return Memory high watermark.

```
Platform getPlatform () noexcept  
    Get the Platform associated with this MemoryResource.
```

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()
```

Release any and all unused memory held by this *AllocationStrategy*.

```
std::size_t getActualSize () const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept  
    Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
    Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
    Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
MemoryResourceTraits m_traits
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Class CudaConstantMemoryResourceFactory

- Defined in file_umpire_resource_CudaConstantMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class CudaConstantMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
    Factory class for constructing MemoryResource objects that use GPU memory.
```

Class CudaDeviceMemoryResource

- Defined in file_umpire_resource_CudaDeviceMemoryResource.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResource (*Class MemoryResource*)

Class Documentation

```
class umpire::resource::CudaDeviceMemoryResource : public umpire::resource::MemoryResource
```

Concrete *MemoryResource* object that uses the template _allocator to allocate and deallocate memory.

Public Functions

```
CudaDeviceMemoryResource (Platform platform, const std::string &name, int id, MemoryResourceTraits traits)
```

```
void *allocate (std::size_t bytes)
```

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- *bytes*: Number of bytes to allocate.

```
void deallocate (void *ptr)
```

Free the memory at *ptr*.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- *ptr*: Pointer to free.

```
std::size_t getCurrentSize () const noexcept
```

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to *getHighWatermark*.

Return current total size of active allocations in this *MemoryResource*.

```
std::size_t getHighWatermark () const noexcept
```

Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by *getCurrentSize*.

Return Memory high watermark.

```
Platform getPlatform () noexcept
```

Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()
```

Release any and all unused memory held by this *AllocationStrategy*.

`std::size_t getActualSize() const noexcept`

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

`std::size_t getAllocationCount() const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`const std::string &getName() noexcept`

Get the name of this `AllocationStrategy`.

Return The name of this `AllocationStrategy`.

`int getId() noexcept`

Get the id of this `AllocationStrategy`.

Return The id of this `AllocationStrategy`.

`AllocationStrategy *getParent() const noexcept`

Traces where the allocator came from.

Return Pointer to the parent `AllocationStrategy`.

Protected Attributes

`alloc::CudaMallocAllocator m_allocator`

`Platform m_platform`

`MemoryResourceTraits m_traits`

`std::string m_name`

`int m_id`

`AllocationStrategy *m_parent`

Class CudaDeviceResourceFactory

- Defined in file `_umpire_resource_CudaDeviceResourceFactory.hpp`

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResourceFactory` (*Class MemoryResourceFactory*)

Class Documentation

```
class CudaDeviceResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class for constructing *MemoryResource* objects that use GPU memory.

Class CudaPinnedMemoryResourceFactory

- Defined in file_umpire_resource_CudaPinnedMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResourceFactory` (*Class MemoryResourceFactory*)

Class Documentation

```
class CudaPinnedMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
```

Class CudaUnifiedMemoryResourceFactory

- Defined in file_umpire_resource_CudaUnifiedMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResourceFactory` (*Class MemoryResourceFactory*)

Class Documentation

```
class CudaUnifiedMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class to construct a *MemoryResource* that uses NVIDIA “unified” memory, accessible from both the CPU and NVIDIA GPUs.

Template Class DefaultMemoryResource

- Defined in file_umpire_resource_DefaultMemoryResource.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResource (*Class MemoryResource*)

Class Documentation

```
template<typename _allocator>
class umpire::resource::DefaultMemoryResource : public umpire::resource::MemoryResource
    Concrete MemoryResource object that uses the template _allocator to allocate and deallocate memory.
```

Public Functions

DefaultMemoryResource (*Platform platform, const std::string &name, int id, MemoryResource-Traits traits*)

DefaultMemoryResource (*Platform platform, const std::string &name, int id, MemoryResource-Traits traits, _allocator alloc*)

void *allocate (std::size_t bytes)

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- bytes*: Number of bytes to allocate.

void deallocate (void *ptr)

Free the memory at ptr.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- ptr*: Pointer to free.

std::size_t getCurrentSize () const noexcept

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to getHighWatermark.

Return current total size of active allocations in this *MemoryResource*.

```
std::size_t getHighWatermark() const noexcept
```

Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by *getCurrentSize*.

Return Memory high watermark.

```
Platform getPlatform() noexcept
```

Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

```
MemoryResourceTraits getTraits() const noexcept override
```

```
void release()
```

Release any and all unused memory held by this *AllocationStrategy*.

```
std::size_t getActualSize() const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount() const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
_allocator m_allocator  
Platform m_platform  
MemoryResourceTraits m_traits  
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class FileMemoryResource

- Defined in file_umpire_resource_FileMemoryResource.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResource (*Class MemoryResource*)

Class Documentation

```
class umpire::resource::FileMemoryResource : public umpire::resource::MemoryResource  
File Memory allocator.
```

This *FileMemoryResource* uses mmap to create a file mapping in order to use as additional memory. To create this mapping the function needs to take in the size of memory wanted for the allocation. The set location for the allocation by default is ./ but can be assigned using environment variable “UMPIRE_MEMORY_FILE_DIR”

The return should be a pointer location. The same pointer location can be used for the deallocation. Deallocation uses munmap and removes the file associated with the pointer location.

Public Functions

```
FileMemoryResource (Platform platform, const std::string &name, int id, MemoryResourceTraits  
traits)  
Construct a new FileMemoryResource.
```

Parameters

- platform: Platform of this instance of the *FileMemoryResource*.
- name: Name of this instance of the *FileMemoryResource*.
- id: Id of this instance of the *FileMemoryResource*.
- traits: Traits of this instance of the *FileMemoryResource*.

```
~FileMemoryResource ()
```

Dallocates and removes all files created by the code meant for allocations.

`void *allocate (std::size_t bytes)`
Creates the allocation of size bytes using mmap.

Does the allocation as follows: 1) Find output file directory for mmap files using UMPIRE_MEMORY_FILE_DIR 2) Create name and create the file index using open 3) Setting Size Of Map File. Size is scaled to a page length on the system. 4) Truncate file using ftruncate64 5) Map file index with mmap 6) Store information about the allocated file into m_size_map

Return void* Since you are only receiving a pointer location of any size non specific to a type you will have to cast it to the desired type if needed.

Parameters

- `bytes`: The requested amount of bytes the user wants to use. Can not be zero or greater than available amount of bytes available.
- `UMPIRE_MEMORY_FILE_DIR`: Used to specify where memory is going to be allocated from

`void deallocate (void *ptr)`
Deallocates file connected to the pointer.

Using m_size_map, the pointer is looked up and the file name and size can be returned. With this munmap can be called to deallocated the correct file.

Parameters

- `ptr`: Pointer location used to look up its information in m_size_map

`std::size_t getCurrentSize () const noexcept`
Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to getHighWatermark.

Return current total size of active allocations in this *MemoryResource*.

`std::size_t getHighWatermark () const noexcept`
Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by getCurrentSize.

Return Memory high watermark.

Platform `getPlatform () noexcept`
Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

MemoryResourceTraits `getTraits () const noexcept override`

`void release ()`
Release any and all unused memory held by this *AllocationStrategy*.

`std::size_t getActualSize () const noexcept`
Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

`std::size_t getAllocationCount () const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`const std::string &getName () noexcept`

Get the name of this `AllocationStrategy`.

Return The name of this `AllocationStrategy`.

`int getId () noexcept`

Get the id of this `AllocationStrategy`.

Return The id of this `AllocationStrategy`.

`AllocationStrategy *getParent () const noexcept`

Traces where the allocator came from.

Return Pointer to the parent `AllocationStrategy`.

Public Static Attributes

`int s_file_counter = {0}`

Protected Attributes

`Platform m_platform`

`MemoryResourceTraits m_traits`

`std::string m_name`

`int m_id`

`AllocationStrategy *m_parent`

Class FileMemoryResourceFactory

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResourceFactory` (*Class MemoryResourceFactory*)

Class Documentation

class FileMemoryResourceFactory : public `umpire::resource::MemoryResourceFactory`
 Factory class to construct a *MemoryResource*.

Class HipConstantMemoryResource

- Defined in file_umpire_resource_HipConstantMemoryResource.hpp

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResource` (*Class MemoryResource*)

Class Documentation

class `umpire::resource::HipConstantMemoryResource : public` `umpire::resource::MemoryResource`

Public Functions

HipConstantMemoryResource (const std::string &name, int id, MemoryResourceTraits traits)

void *allocate (std::size_t bytes)

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- `bytes`: Number of bytes to allocate.

void deallocate (void *ptr)

Free the memory at `ptr`.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- `ptr`: Pointer to free.

`std::size_t getCurrentSize() const noexcept`

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark`.

Return current total size of active allocations in this *MemoryResource*.

`std::size_t getHighWatermark() const noexcept`

Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by `getCurrentSize`.

Return Memory high watermark.

Platform `getPlatform() noexcept`

Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

MemoryResourceTraits `getTraits() const noexcept override`

`void release()`

Release any and all unused memory held by this *AllocationStrategy*.

`std::size_t getActualSize() const noexcept`

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

`std::size_t getAllocationCount() const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`const std::string &getName() noexcept`

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

`int getId() noexcept`

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

`AllocationStrategy *getParent() const noexcept`

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

- Defined in file_umpire_resource_HipConstantMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class HipConstantMemoryResourceFactory : public umpire::resource::MemoryResourceFactory  
Factory class for constructing MemoryResource objects that use GPU memory.
```

Class HipDeviceMemoryResource

- Defined in file_umpire_resource_HipDeviceMemoryResource.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResource (*Class MemoryResource*)

Class Documentation

```
class umpire::resource::HipDeviceMemoryResource : public umpire::resource::MemoryResource  
Concrete MemoryResource object that uses the template _allocator to allocate and deallocate memory.
```

Public Functions

HipDeviceMemoryResource (*Platform platform, const std::string &name, int id, MemoryResourceTraits traits*)

void *allocate (std::size_t bytes)

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- *bytes*: Number of bytes to allocate.

void deallocate (void *ptr)

Free the memory at *ptr*.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- *ptr*: Pointer to free.

std::size_t getCurrentSize () const noexcept

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to *getHighWatermark*.

Return current total size of active allocations in this *MemoryResource*.

std::size_t getHighWatermark () const noexcept

Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by *getCurrentSize*.

Return Memory high watermark.

Platform **getPlatform () noexcept**

Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

MemoryResourceTraits **getTraits () const noexcept override**

void release ()

Release any and all unused memory held by this *AllocationStrategy*.

std::size_t getActualSize () const noexcept

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId () noexcept
Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent () const noexcept
Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

- public `umpire::resource::NullMemoryResource` (*Class NullMemoryResource*)
- public `umpire::resource::SyclDeviceMemoryResource< _allocator >` (*Template Class SyclDeviceMemoryResource*)

Class Documentation

class `umpire::resource::MemoryResource` : **public** `umpire::strategy::AllocationStrategy`

Base class to represent the available hardware resources for memory allocation in the system.

Objects of this inherit from `strategy::AllocationStrategy`, allowing them to be used directly.

Subclassed by `umpire::resource::CudaConstantMemoryResource`, `umpire::resource::CudaDeviceMemoryResource`, `umpire::resource::DefaultMemoryResource< _allocator >`, `umpire::resource::FileMemoryResource`, `umpire::resource::HipConstantMemoryResource`, `umpire::resource::HipDeviceMemoryResource`, `umpire::resource::NullMemoryResource`, `umpire::resource::SyclDeviceMemoryResource< _allocator >`

Public Functions

MemoryResource (**const** `std::string &name`, `int id`, `MemoryResourceTraits traits`)

Construct a `MemoryResource` with the given name and id.

Parameters

- `name`: Name of the `MemoryResource`.
- `id`: ID of the `MemoryResource` (must be unique).

~MemoryResource () = default

```
void *allocate (std::size_t bytes) override = 0
Allocate bytes of memory.
```

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- `bytes`: Number of bytes to allocate.

```
void deallocate (void *ptr) override = 0
Free the memory at ptr.
```

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- `ptr`: Pointer to free.

```
std::size_t getCurrentSize () const noexcept override = 0
Return the current size of this MemoryResource.
```

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark`.

Return current total size of active allocations in this *MemoryResource*.

```
std::size_t getHighWatermark () const noexcept override = 0
Return the memory high watermark for this MemoryResource.
```

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by `getCurrentSize`.

Return Memory high watermark.

```
Platform getPlatform () noexcept override
Get the Platform associated with this MemoryResource.
```

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()
Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize () const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
MemoryResourceTraits m_traits  
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class MemoryResourceFactory

Class Documentation

class umpire::resource::MemoryResourceFactory
Abstract factory class for constructing *MemoryResource* objects.

Concrete implementations of this class are used by the *MemoryResourceRegistry* to construct *MemoryResource* objects.

See *MemoryResourceRegistry*

Subclassed by `umpire::resource::CudaConstantMemoryResourceFactory`, `umpire::resource::CudaDeviceResourceFactory`, `umpire::resource::CudaPinnedMemoryResourceFactory`, `umpire::resource::CudaUnifiedMemoryResourceFactory`, `umpire::resource::FileMemoryResourceFactory`, `umpire::resource::HipConstantMemoryResourceFactory`, `umpire::resource::HipDeviceResourceFactory`, `umpire::resource::HipPinnedMemoryResourceFactory`, `umpire::resource::HostResourceFactory`, `umpire::resource::NullMemoryResourceFactory`, `umpire::resource::OpenMPTargetResourceFactory`, `umpire::resource::SyclDeviceResourceFactory`, `umpire::resource::SyclPinnedMemoryResourceFactory`, `umpire::resource::SyclUnifiedMemoryResourceFactory`

Public Functions

`~MemoryResourceFactory()` = default
`bool isValidMemoryResourceFor(const std::string &name) noexcept = 0`
`std::unique_ptr<resource::MemoryResource> create(const std::string &name, int id) = 0`
Construct a *MemoryResource* with the given name and id.

Parameters

- `name`: Name of the *MemoryResource*.
- `id`: ID of the *MemoryResource*.
- `traits`: Traits for the *MemoryResource*

`std::unique_ptr<resource::MemoryResource> create(const std::string &name, int id, MemoryResourceTraits traits) = 0`
Construct a *MemoryResource* with the given name and id.

Parameters

- `name`: Name of the *MemoryResource*.
- `id`: ID of the *MemoryResource*.
- `traits`: Traits for the *MemoryResource*

MemoryResourceTraits `getDefautlTraits()` = 0

Class MemoryResourceRegistry

- Defined in file_umpire_resource_MemoryResourceRegistry.hpp

Class Documentation

```
class umpire::resource::MemoryResourceRegistry
```

Public Functions

```
std::unique_ptr<resource::MemoryResource> makeMemoryResource (const std::string &name, int  
id)  
std::unique_ptr<resource::MemoryResource> makeMemoryResource (const std::string &name,  
int id, MemoryResourceTraits  
traits)  
void registerMemoryResource (std::unique_ptr<MemoryResourceFactory> &&factory)  
MemoryResourceTraits getDefaultTraitsForResource (const std::string &name)  
MemoryResourceRegistry (const MemoryResourceRegistry&) = delete  
MemoryResourceRegistry &operator= (const MemoryResourceRegistry&) = delete  
~MemoryResourceRegistry () = default
```

Public Static Functions

```
MemoryResourceRegistry &getInstance () noexcept
```

Class NullMemoryResource

- Defined in file_umpire_resource_NullMemoryResource.hpp

Inheritance Relationships

Base Type

- public `umpire::resource::MemoryResource` (*Class MemoryResource*)

Class Documentation

```
class umpire::resource::NullMemoryResource : public umpire::resource::MemoryResource
```

Public Functions

`NullMemoryResource (Platform platform, const std::string &name, int id, MemoryResourceTraits traits)`

`void *allocate (std::size_t bytes)`

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- `bytes`: Number of bytes to allocate.

`void deallocate (void *ptr)`

Free the memory at `ptr`.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- `ptr`: Pointer to free.

`std::size_t getCurrentSize () const noexcept`

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark`.

Return current total size of active allocations in this *MemoryResource*.

`std::size_t getHighWatermark () const noexcept`

Return the memory high watermark for this *MemoryResource*.

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by `getCurrentSize`.

Return Memory high watermark.

`Platform getPlatform () noexcept`

Get the Platform associated with this *MemoryResource*.

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

MemoryResourceTraits **getTraits () const noexcept override**

void release ()

Release any and all unused memory held by this *AllocationStrategy*.

std::size_t getActualSize () const noexcept

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

std::size_t getAllocationCount () const noexcept

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

const std::string &getName () noexcept

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

int getId () noexcept

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

AllocationStrategy ***getParent () const noexcept**

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

Platform **m_platform**

MemoryResourceTraits **m_traits**

std::string **m_name**

int m_id

AllocationStrategy ***m_parent**

Class NullMemoryResourceFactory

- Defined in file_umpire_resource_NullMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class NullMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class for constructing *MemoryResource* objects that use GPU memory.

Class OpenMPTargetResourceFactory

- Defined in file_umpire_resource_OpenMPTargetMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class umpire::resource::OpenMPTargetResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class for constructing *MemoryResource* objects that use GPU memory.

Public Functions

```
bool isValidMemoryResourceFor(const std::string &name) noexcept final override  
std::unique_ptr<resource::MemoryResource> create(const std::string &name, int id) final  
override
```

Construct a *MemoryResource* with the given name and id.

Parameters

- name*: Name of the *MemoryResource*.
- id*: ID of the *MemoryResource*.
- traits*: Traits for the *MemoryResource*

```
std::unique_ptr<resource::MemoryResource> create(const std::string &name, int id, MemoryRe-  
sourceTraits traits) final override
```

Construct a *MemoryResource* with the given name and id.

Parameters

- `name`: Name of the *MemoryResource*.
- `id`: ID of the *MemoryResource*.
- `traits`: Traits for the *MemoryResource*

MemoryResourceTraits `getDefaultTraits () final override`

Template Class `SyclDeviceMemoryResource`

- Defined in file `_umpire_resource_SyclDeviceMemoryResource.hpp`

Inheritance Relationships

Base Type

- `public umpire::resource::MemoryResource (Class MemoryResource)`

Class Documentation

```
template<typename _allocator>
class umpire::resource::SyclDeviceMemoryResource : public umpire::resource::MemoryResource
    Concrete MemoryResource object that uses the template _allocator to allocate and deallocate memory.
```

Public Functions

`SyclDeviceMemoryResource (Platform platform, const std::string &name, int id, MemoryResourceTraits traits)`

`void *allocate (std::size_t bytes)`

Allocate bytes of memory.

This function is pure virtual and must be implemented by the inheriting class.

Return Pointer to start of allocation.

Parameters

- `bytes`: Number of bytes to allocate.

`void deallocate (void *ptr)`

Free the memory at `ptr`.

This function is pure virtual and must be implemented by the inheriting class.

Parameters

- `ptr`: Pointer to free.

`std::size_t getCurrentSize () const noexcept`

Return the current size of this *MemoryResource*.

This is sum of the sizes of all the tracked allocations. Note that this doesn't ever have to be equal to `getHighWatermark`.

Return current total size of active allocations in this *MemoryResource*.

```
std::size_t getHighWatermark () const noexcept  
    Return the memory high watermark for this MemoryResource.
```

This is the largest amount of memory allocated by this *Allocator*. Note that this may be larger than the largest value returned by *getCurrentSize*.

Return Memory high watermark.

```
Platform getPlatform () noexcept  
    Get the Platform associated with this MemoryResource.
```

This function is pure virtual and must be implemented by the inheriting class.

Return Platform associated with this *MemoryResource*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()  
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize () const noexcept  
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept  
    Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept  
    Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId () noexcept  
    Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent () const noexcept  
    Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
_allocator m_allocator  
Platform m_platform  
MemoryResourceTraits m_traits  
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class **SyclDeviceResourceFactory**

- Defined in file_umpire_resource_SyclDeviceResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class SyclDeviceResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class for constructing *MemoryResource* objects that use Intel's GPU memory.

Class **SyclPinnedMemoryResourceFactory**

- Defined in file_umpire_resource_SyclPinnedMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class SyclPinnedMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
```

Class **SyclUnifiedMemoryResourceFactory**

- Defined in file_umpire_resource_SyclUnifiedMemoryResourceFactory.hpp

Inheritance Relationships

Base Type

- public umpire::resource::MemoryResourceFactory (*Class MemoryResourceFactory*)

Class Documentation

```
class SyclUnifiedMemoryResourceFactory : public umpire::resource::MemoryResourceFactory
```

Factory class to construct a *MemoryResource* that uses Intel’s “unified shared” memory (USM), accessible from both the CPU and Intel GPUs.

Class **ResourceManager**

- Defined in file_umpire_Manager.hpp

Class Documentation

```
class umpire::ResourceManager
```

Public Functions

```
void initialize()
```

Initialize the *ResourceManager*.

This will create all registered MemoryResource objects

```
std::vector<std::string> getAllocatorNames() const noexcept
```

Get the names of all available *Allocator* objects.

```
std::vector<int> getAllocatorIds() const noexcept
```

Get the ids of all available *Allocator* objects.

```
Allocator getAllocator(const std::string &name)
```

Get the *Allocator* with the given name.

```
Allocator getAllocator(const char *name)
```

```
Allocator getAllocator(resource::MemoryResourceType resource_type)
```

Get the default *Allocator* for the given resource_type.

```
Allocator getAllocator(int id)
```

Get the *Allocator* with the given ID.

```
Allocator getDefaultAllocator()
```

Get the default *Allocator*.

The default *Allocator* is used whenever an *Allocator* is required and one is not provided, or cannot be inferred.

Return The default *Allocator*.

```
void setDefaultAllocator (Allocator allocator) noexcept
    Set the default Allocator.
```

The default *Allocator* is used whenever an *Allocator* is required and one is not provided, or cannot be inferred.

Parameters

- *allocator*: The *Allocator* to use as the default.

```
template<typename Strategy, bool introspection = true, typename ...ArgsAllocator makeAllocator (const std::string &name, Args&... args)
    Construct a new Allocator.
```

```
Allocator makeResource (const std::string &name)
```

```
Allocator makeResource (const std::string &name, MemoryResourceTraits traits)
```

```
void registerAllocator (const std::string &name, Allocator allocator)
```

Register an *Allocator* with the *ResourceManager*.

After registration, the *Allocator* can be retrieved by calling *getAllocator(name)*.

The same *Allocator* can be registered under multiple names.

Parameters

- *name*: Name to register *Allocator* with.
- *allocator*: *Allocator* to register.

```
Allocator getAllocator (void *ptr)
```

Get the *Allocator* used to allocate *ptr*.

Return *Allocator* for the given *ptr*.

Parameters

- *ptr*: Pointer to find the *Allocator* for.

```
bool isAllocator (const std::string &name) noexcept
```

```
bool hasAllocator (void *ptr)
```

Does the given pointer have an associated *Allocator*.

Return True if the pointer has an associated *Allocator*.

```
void registerAllocation (void *ptr, util::AllocationRecord record)
    register an allocation with the manager.
```

```
util::AllocationRecord deregisterAllocation (void *ptr)
    de-register the address ptr with the manager.
```

Return the allocation record removed from the manager.

```
const util::AllocationRecord *findAllocationRecord (void *ptr) const
```

Find the allocation record associated with an address *ptr*.

Return the record if found, or throws an exception if not found.

```
bool isAllocatorRegistered(const std::string &name)
```

Check whether the named *Allocator* exists.

```
void copy(void *dst_ptr, void *src_ptr, std::size_t size = 0)
```

Copy size bytes of data from src_ptr to dst_ptr.

Both the src_ptr and dst_ptr addresses must be allocated by Umpire. They can be offset from any Umpire-managed base address.

The dst_ptr must be large enough to accommodate size bytes of data.

Parameters

- dst_ptr: Destination pointer.
- src_ptr: Source pointer.
- size: Size in bytes.

```
camp::resources::Event copy(void *dst_ptr, void *src_ptr, camp::resources::Resource &ctx, std::size_t size = 0)
```

```
void memset(void *ptr, int val, std::size_t length = 0)
```

Set the first length bytes of ptr to the value val.

Parameters

- ptr: Pointer to data.
- val: Value to set.
- length: Number of bytes to set to val.

```
void *reallocate(void *current_ptr, std::size_t new_size)
```

Reallocate current_ptr to new_size.

If current_ptr is nullptr, then the default allocator will be used to allocate data. The default allocator may be set with a call to *setDefaultAllocator(Allocator allocator)*.

Parameters

- current_ptr: Source pointer to reallocate.
- new_size: New size of pointer.

NOTE 1: This is not thread safe
NOTE 2: If the allocator for which current_ptr is intended is different from the default allocator, then all subsequent `reallocate` calls will result in allocations from the default allocator which may not be the intended behavior.

If new_size is 0, then the current_ptr will be deallocated if it is not a nullptr, and a zero-byte allocation will be returned.

Return Reallocated pointer.

```
void *reallocate(void *current_ptr, std::size_t new_size, Allocator allocator)
```

Reallocate current_ptr to new_size.

If current_ptr is null, then allocator will be used to allocate the data.

Parameters

- current_ptr: Source pointer to reallocate.

- `new_size`: New size of pointer.
- `allocator`: *Allocator* to use if `current_ptr` is null.

If `new_size` is 0, then the `current_ptr` will be deallocated if it is not a `nullptr`, and a zero-byte allocation will be returned.

Return Reallocated pointer.

```
void *move (void *src_ptr, Allocator allocator)
Move src_ptr to memory from allocator.
```

Return Pointer to new location of data.

Parameters

- `src_ptr`: Pointer to move.
- `allocator`: *Allocator* to use to allocate new memory for moved data.

```
void deallocate (void *ptr)
Deallocate any pointer allocated by an Umpire-managed resource.
```

Parameters

- `ptr`: Pointer to deallocate.

```
std::size_t getSize (void *ptr) const
Get the size in bytes of the allocation for the given pointer.
```

Return Size of allocation in bytes.

Parameters

- `ptr`: Pointer to find size of.

```
std::shared_ptr<op::MemoryOperation> getOperation (const std::string &operation_name, Allocator src_allocator, Allocator dst_allocator)
int getNumDevices () const
~ResourceManager ()
ResourceManager (const ResourceManager&) = delete
ResourceManager &operator= (const ResourceManager&) = delete
```

Public Static Functions

```
ResourceManager &getInstance ()
```

Class AlignedAllocator

- Defined in file_umpire_strategy_AlignedAllocator.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::AlignedAllocator : public umpire::strategy::AllocationStrategy
```

Public Functions

```
AlignedAllocator(const std::string &name, int id, Allocator allocator, std::size_t alignment = 16)
void *allocate(std::size_t bytes) override
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate(void *ptr) override
    Free the memory at ptr.
```

Parameters

- ptr: Pointer to free.

```
Platform getPlatform() noexcept override
    Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits() const noexcept override
```

```
void release()
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getCurrentSize() const noexcept
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept
```

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
std::size_t getActualSize () const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
```

Get the name of this `AllocationStrategy`.

Return The name of this `AllocationStrategy`.

```
int getId () noexcept
```

Get the id of this `AllocationStrategy`.

Return The id of this `AllocationStrategy`.

```
AllocationStrategy *getParent () const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent `AllocationStrategy`.

Protected Attributes

```
strategy::AllocationStrategy *m_allocator
```

```
std::string m_name
```

```
int m_id
```

```
AllocationStrategy *m_parent
```

Class AllocationAdvisor

- Defined in file `_umpire_strategy_AllocationAdvisor.hpp`

Inheritance Relationships

Base Type

- public `umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::AllocationAdvisor : public umpire::strategy::AllocationStrategy
```

Applies the given MemoryOperation to every allocation.

This *AllocationStrategy* is designed to be used with the following operations:

- `op::CudaAdviseAccessedByOperation`
- `op::CudaAdvisePreferredLocationOperation`
- `op::CudaAdviseReadMostlyOperation`

Using this *AllocationStrategy* when combined with a pool like DynamicPool is a good way to mitigate the overhead of applying the memory advice.

Public Functions

```
AllocationAdvisor(const std::string &name, int id, Allocator allocator, const std::string &device_operation, int device_id = 0)
```

```
AllocationAdvisor(const std::string &name, int id, Allocator allocator, const std::string &device_operation, Allocator accessing_allocator, int device_id = 0)
```

```
void *allocate(std::size_t bytes) override  
Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- `bytes`: Number of bytes to allocate.

```
void deallocate(void *ptr) override  
Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
Platform getPlatform() noexcept override  
Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits() const noexcept override
```

```
void release()  
    Release any and all unused memory held by this AllocationStrategy.  
  
std::size_t getCurrentSize() const noexcept  
    Get current (total) size of the allocated memory.  
  
    This is the total size of all allocation currently ‘live’ that have been made by this AllocationStrategy object.  
  
Return Current total size of allocations.  
  
std::size_t getHighWatermark() const noexcept  
    Get the high watermark of the total allocated size.  
  
    This is equivalent to the highest observed value of getCurrentSize.  
  
Return High watermark allocation size.  
  
std::size_t getActualSize() const noexcept  
    Get the current amount of memory allocated by this allocator.  
  
    Note that this can be larger than getCurrentSize(), particularly if the AllocationStrategy implements some kind of pooling.  
  
Return The total size of all the memory this object has allocated.  
  
std::size_t getAllocationCount() const noexcept  
    Get the total number of active allocations by this allocator.  
  
Return The total number of active allocations this object has allocated.  
  
const std::string &getName() noexcept  
    Get the name of this AllocationStrategy.  
  
Return The name of this AllocationStrategy.  
  
int getId() noexcept  
    Get the id of this AllocationStrategy.  
  
Return The id of this AllocationStrategy.  
  
AllocationStrategy *getParent() const noexcept  
    Traces where the allocator came from.  
  
Return Pointer to the parent AllocationStrategy.
```

Protected Attributes

```
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class AllocationPrefetcher

- Defined in file_umpire_strategy_AllocationPrefetcher.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::AllocationPrefetcher : public umpire::strategy::AllocationStrategy
```

Apply the appropriate “PREFETCH” operation to every allocation.

Public Functions

```
AllocationPrefetcher (const std::string &name, int id, Allocator allocator, int device_id = 0)  
void *allocate (std::size_t bytes) override  
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate (void *ptr) override  
    Free the memory at ptr.
```

Parameters

- ptr: Pointer to free.

```
Platform getPlatform () noexcept override  
Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()  
Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getCurrentSize () const noexcept  
Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept
```

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
std::size_t getActualSize () const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
```

Get the name of this `AllocationStrategy`.

Return The name of this `AllocationStrategy`.

```
int getId () noexcept
```

Get the id of this `AllocationStrategy`.

Return The id of this `AllocationStrategy`.

```
AllocationStrategy *getParent () const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent `AllocationStrategy`.

Protected Attributes

```
std::string m_name
```

```
int m_id
```

```
AllocationStrategy *m_parent
```

Class Documentation

class `umpire::strategy::AllocationStrategy`

AllocationStrategy provides a unified interface to all classes that can be used to allocate and free data.

Subclassed by `umpire::resource::MemoryResource`, `umpire::strategy::AlignedAllocator`,
`umpire::strategy::AllocationAdvisor`, `umpire::strategy::AllocationPrefetcher`, `umpire::strategy::AllocationTracker`, `umpire::strategy::DynamicPoolList`, `umpire::strategy::DynamicPoolMap`,
`umpire::strategy::FixedPool`, `umpire::strategy::MixedPool`, `umpire::strategy::MonotonicAllocationStrategy`,
`umpire::strategy::NamedAllocationStrategy`, `umpire::strategy::NumaPolicy`, `umpire::strategy::QuickPool`,
`umpire::strategy::SizeLimiter`, `umpire::strategy::SlotPool`, `umpire::strategy::ThreadSafeAllocator`, `umpire::strategy::ZeroByteHandler`

Public Functions

AllocationStrategy (**const std::string &name**, **int id**, *AllocationStrategy *parent*) **noexcept**
 Construct a new *AllocationStrategy* object.

All *AllocationStrategy* objects must will have a unique name and id. This uniqueness is enforced by the *ResourceManager*.

Parameters

- *name*: The name of this *AllocationStrategy* object.
- *id*: The id of this *AllocationStrategy* object.

~AllocationStrategy () = default

void *allocate (std::size_t bytes) = 0
 Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- *bytes*: Number of bytes to allocate.

void deallocate (void *ptr) = 0

Free the memory at *ptr*.

Parameters

- *ptr*: Pointer to free.

void release ()

Release any and all unused memory held by this *AllocationStrategy*.

std::size_t getCurrentSize () const noexcept

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

std::size_t getHighWatermark () const noexcept

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of *getCurrentSize*.

Return High watermark allocation size.

std::size_t getActualSize () const noexcept

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

std::size_t getAllocationCount () const noexcept

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`Platform getPlatform() noexcept = 0`

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

`const std::string &getName() noexcept`

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

`int getId() noexcept`

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

`AllocationStrategy *getParent() const noexcept`

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

`MemoryResourceTraits getTraits() const noexcept`

Protected Attributes

`std::string m_name`

`int m_id`

`AllocationStrategy *m_parent`

Friends

`friend std::ostream &operator<< (std::ostream &os, const AllocationStrategy &strategy)`

Class AllocationTracker

- Defined in file_umpire_strategy_AllocationTracker.hpp

Inheritance Relationships

Base Types

- public `umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)
- private `umpire::strategy::mixins::Inspector` (*Class Inspector*)

Class Documentation

```
class umpire::strategy::AllocationTracker : public umpire::strategy::AllocationStrategy, private umpire::strat
```

Public Functions

```
AllocationTracker (std::unique_ptr<AllocationStrategy> &&allocator) noexcept
void *allocate (std::size_t bytes) override
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- *bytes*: Number of bytes to allocate.

```
void deallocate (void *ptr) override
    Free the memory at ptr.
```

Parameters

- *ptr*: Pointer to free.

```
void release () override
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getCurrentSize () const noexcept override
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept override
    Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of *getCurrentSize*.

Return High watermark allocation size.

```
std::size_t getActualSize () const noexcept override
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept override  
Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
Platform getPlatform () noexcept override  
Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
strategy::AllocationStrategy *getAllocationStrategy ()  
MemoryResourceTraits getTraits () const noexcept override  
const std::string &getName () noexcept  
Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId () noexcept  
Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent () const noexcept  
Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

```

Private Members

```
std::size_t m_current_size
std::size_t m_high_watermark
std::size_t m_allocation_count
```

Class DynamicPoolList

- Defined in file_umpire_strategy_DynamicPoolList.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::DynamicPoolList : public umpire::strategy::AllocationStrategy
Simple dynamic pool for allocations.
```

This *AllocationStrategy* uses Simpool to provide pooling for allocations of any size. The behavior of the pool can be controlled by two parameters: the initial allocation size, and the minimum allocation size.

The initial size controls how large the first piece of memory allocated is, and the minimum size controls the lower bound on all future chunk allocations.

Public Types

```
using CoalesceHeuristic = std::function<bool (const strategy::DynamicPoolList&) >
```

Public Functions

```
DynamicPoolList(const std::string &name, int id, Allocator allocator, const std::size_t
                first_minimum_pool_allocation_size = (512 * 1024 * 1024), const std::size_t
                next_minimum_pool_allocation_size = (1 * 1024 * 1024), const std::size_t
                alignment = 16, CoalesceHeuristic should_coalesce = percent_releasable(100))
noexcept
```

Construct a new *DynamicPoolList*.

Parameters

- name:** Name of this instance of the *DynamicPoolList*.
- id:** Id of this instance of the *DynamicPoolList*.
- allocator:** Allocation resource that pool uses
- first_minimum_pool_allocation_size:** Minimum size the pool initially allocates
- next_minimum_pool_allocation_size:** The minimum size of all future allocations.
- align_bytes:** Number of bytes with which to align allocation sizes (power-of-2)

- `do_heuristic`: Heuristic for when to perform coalesce operation

```
DynamicPoolList(const DynamicPoolList&) = delete
void *allocate(size_t bytes) override
void deallocate(void *ptr) override
    Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
void release() override
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize() const noexcept override
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getCurrentSize() const noexcept override
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
Platform getPlatform() noexcept override
    Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits() const noexcept final override
```

```
std::size_t getReleasableSize() const noexcept
    Get the number of bytes that may be released back to resource.
```

A memory pool has a set of blocks that have no allocations against them. If the size of the set is greater than one, then the pool will have a number of bytes that may be released back to the resource or coalesced into a larger block.

Return The total number of bytes that are releasable

```
std::size_t getBlocksInPool() const noexcept
    Get the number of memory blocks that the pool has.
```

Return The total number of blocks that are allocated by the pool

```
std::size_t getLargestAvailableBlock() const noexcept
    Get the largest allocatable number of bytes from pool before the pool will grow.
```

return The largest number of bytes that may be allocated without causing pool growth

```
void coalesce() noexcept
void *allocate(std::size_t bytes) = 0
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- *bytes*: Number of bytes to allocate.

```
std::size_t getHighWatermark() const noexcept
    Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
std::size_t getAllocationCount() const noexcept
    Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
    Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
    Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
    Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Public Static Functions

```
CoalesceHeuristic percent_releasable(int percentage)
```

Protected Attributes

```
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Class DynamicPoolMap

- Defined in file_umpire_strategy_DynamicPoolMap.hpp

Inheritance Relationships

Base Types

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)
- private umpire::strategy::mixins::AlignedAllocation (*Class AlignedAllocation*)

Class Documentation

```
class umpire::strategy::DynamicPoolMap : public umpire::strategy::AllocationStrategy, private umpire::strategy::
```

Simple dynamic pool for allocations.

This *AllocationStrategy* uses Simpool to provide pooling for allocations of any size. The behavior of the pool can be controlled by two parameters: the initial allocation size, and the minimum allocation size.

The initial size controls how large the first piece of memory allocated is, and the minimum size controls the lower bound on all future chunk allocations.

Public Types

```
using Pointer = void*
using CoalesceHeuristic = std::function<bool (const strategy::DynamicPoolMap&) >
```

Public Functions

```
DynamicPoolMap(const std::string &name, int id, Allocator allocator, const std::size_t
first_minimum_pool_allocation_size = (512 * 1024 * 1024), const std::size_t
min_alloc_size = (1 * 1024 * 1024), const std::size_t align_bytes = 16, Coa-
lesceHeuristic should_coalesce = percent_releasable(100)) noexcept
```

Construct a new *DynamicPoolMap*.

Parameters

- name: Name of this instance of the *DynamicPoolMap*
- id: Unique identifier for this instance
- allocator: Allocation resource that pool uses
- first_minimum_pool_allocation_size: Size the pool initially allocates
- next_minimum_pool_allocation_size: The minimum size of all future allocations
- align_bytes: Number of bytes with which to align allocation sizes (power-of-2)
- should_coalesce: Heuristic for when to perform coalesce operation

```
~DynamicPoolMap()
```

```
DynamicPoolMap(const DynamicPoolMap&) = delete
```

```
void *allocate(std::size_t bytes) override
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- `bytes`: Number of bytes to allocate.

```
void deallocate(void *ptr) override
    Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
void release() override
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize() const noexcept override
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getCurrentSize() const noexcept override
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
Platform getPlatform() noexcept override
    Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits() const noexcept override
```

```
std::size_t getReleasableSize() const noexcept
```

Returns the number of bytes of unallocated data held by this pool that could be immediately released back to the resource.

A memory pool has a set of blocks that are not leased out to the application as allocations. Allocations from the resource begin as a single chunk, but these could be split, and only the first chunk can be deallocated back to the resource immediately.

Return The total number of bytes that are immediately releasable.

```
std::size_t getFreeBlocks() const noexcept
```

Return the number of free memory blocks that the pools holds.

```
std::size_t getInUseBlocks() const noexcept
```

Return the number of used memory blocks that the pools holds.

`std::size_t getBlocksInPool() const noexcept`

Return the number of memory blocks both leased to application and internal free memory that the pool holds.

`std::size_t getLargestAvailableBlock() noexcept`

Get the largest allocatable number of bytes from pool before the pool will grow.

return The largest number of bytes that may be allocated without causing pool growth

`void coalesce()`

Merge as many free records as possible, release all possible free blocks, then reallocate a chunk to keep the actual size the same.

`std::size_t getHighWatermark() const noexcept`

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

`std::size_t getAllocationCount() const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`const std::string &getName() noexcept`

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

`int getId() noexcept`

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

AllocationStrategy *`getParent() const noexcept`

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Public Static Functions

CoalesceHeuristic `percent_releasable(int percentage)`

Protected Attributes

`std::string m_name`

`int m_id`

AllocationStrategy *`m_parent`

Private Functions

```
std::size_t aligned_round_up (std::size_t size)
    Round up the size to be an integral multiple of configured alignment.
```

Return Size rounded up to be integral multiple of configured alignment

```
void *aligned_allocate (const std::size_t size)
    Return an allocation of size bytes that is aligned on the configured alignment boundary.
```

```
void aligned_deallocate (void *ptr)
    Deallocate previously aligned allocation.
```

Private Members

```
strategy::AllocationStrategy *m_allocator
```

Class FixedPool

- Defined in file_umpire_strategy_FixedPool.hpp

Nested Relationships

Nested Types

- Struct FixedPool::Pool*

Inheritance Relationships

Base Type

- `public umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::FixedPool : public umpire::strategy::AllocationStrategy
    Pool for fixed size allocations.
```

This *AllocationStrategy* provides an efficient pool for fixed size allocations, and used to quickly allocate and deallocate objects.

Public Functions

```
FixedPool (const std::string &name, int id, Allocator allocator, const std::size_t object_bytes,  
          const std::size_t objects_per_pool = 64 * sizeof(int) * 8) noexcept  
Constructs a FixedPool.
```

Parameters

- name: The allocator name for reference later in *ResourceManager*
- id: The allocator id for reference later in *ResourceManager*
- allocator: Used for data allocation. It uses std::malloc for internal tracking of these allocations.
- object_bytes: The fixed size (in bytes) for each allocation
- objects_per_pool: Number of objects in each sub-pool internally. Performance likely improves if this is large, at the cost of memory usage. This does not have to be a multiple of sizeof(int)*8, but it will also likely improve performance if so.

```
~FixedPool ()
```

```
FixedPool (const FixedPool&) = delete  
void *allocate (std::size_t bytes = 0) final override  
Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate (void *ptr) final override  
Free the memory at ptr.
```

Parameters

- ptr: Pointer to free.

```
std::size_t getCurrentSize () const noexcept final override  
Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept final override  
Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of *getCurrentSize*.

Return High watermark allocation size.

```
std::size_t getActualSize () const noexcept final override  
Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
Platform getPlatform() noexcept final override
```

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits() const noexcept final override
```

```
bool pointerIsFromPool(void *ptr) const noexcept
```

```
std::size_t numPools() const noexcept
```

```
void release()
```

Release any and all unused memory held by this *AllocationStrategy*.

```
std::size_t getAllocationCount() const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name
```

```
int m_id
```

```
AllocationStrategy *m_parent
```

Class MixedPool

- Defined in file_umpire_strategy_MixedPool.hpp

Inheritance Relationships

Base Type

- public `umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::MixedPool : public umpire::strategy::AllocationStrategy
```

A faster pool that pulls from a series of pools.

Pool implementation using a series of FixedPools for small sizes, and a DynamicPool for sizes larger than (1 << LastFixed) bytes.

Public Functions

```
MixedPool(const std::string &name, int id, Allocator allocator, std::size_t smallest_fixed_obj_size = (1 << 8), std::size_t largest_fixed_obj_size = (1 << 17), std::size_t max_initial_fixed_pool_size = 1024 * 1024 * 2, std::size_t fixed_size_multiplier = 16, const std::size_t dynamic_initial_alloc_size = (512 * 1024 * 1024), const std::size_t dynamic_min_alloc_size = (1 * 1024 * 1024), const std::size_t dynamic_align_bytes = 16, DynamicPoolMap::CoalesceHeuristic should_coalesce = DynamicPoolMap::percent_releasable(100)) noexcept
```

Creates a *MixedPool* of one or more fixed pools and a dynamic pool for large allocations.

Parameters

- name: Name of the pool
- id: Unique identifier for lookup later in *ResourceManager*
- allocator: Underlying allocator
- smallest_fixed_obj_size: Smallest fixed pool object size in bytes
- largest_fixed_obj_size: Largest fixed pool object size in bytes
- max_initial_fixed_pool_size: Largest initial size of any fixed pool
- fixed_size_multiplier: Fixed pool object size increase factor
- dynamic_initial_alloc_size: Size the dynamic pool initially allocates
- dynamic_min_alloc_bytes: Minimum size of all future allocations in the dynamic pool
- dynamic_align_bytes: Size with which to align allocations (for the dynamic pool)
- should_coalesce: Heuristic callback function (for the dynamic pool)

```
void *allocate(std::size_t bytes) override
```

Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate (void *ptr) override
    Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
void release () override
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getCurrentSize () const noexcept override
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getActualSize () const noexcept override
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getHighWatermark () const noexcept override
    Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
Platform getPlatform () noexcept override
    Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
std::size_t getAllocationCount () const noexcept
    Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
    Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId () noexcept
    Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

`AllocationStrategy *getParent () const noexcept`

Traces where the allocator came from.

Return Pointer to the parent `AllocationStrategy`.

Protected Attributes

`std::string m_name`

`int m_id`

`AllocationStrategy *m_parent`

Class AlignedAllocation

- Defined in file `_umpire_strategy_mixins_AlignedAllocation.hpp`

Inheritance Relationships

Derived Types

- `private DynamicSizePool< IA >` (*Template Class DynamicSizePool*)
- `private umpire::strategy::DynamicPoolMap` (*Class DynamicPoolMap*)
- `private umpire::strategy::QuickPool` (*Class QuickPool*)

Class Documentation

`class umpire::strategy::mixins::AlignedAllocation`

Subclassed by `DynamicSizePool< IA >, umpire::strategy::DynamicPoolMap, umpire::strategy::QuickPool`

Public Functions

`AlignedAllocation () = delete`

`AlignedAllocation (std::size_t alignment, strategy::AllocationStrategy *strategy)`

`std::size_t aligned_round_up (std::size_t size)`

Round up the size to be an integral multiple of configured alignment.

Return Size rounded up to be integral multiple of configured alignment

`void *aligned_allocate (const std::size_t size)`

Return an allocation of `size` bytes that is aligned on the configured alignment boundary.

`void aligned_deallocate (void *ptr)`

Deallocate previously aligned allocation.

Protected Attributes

```
strategy::AllocationStrategy *m_allocator
```

Class Inspector

- Defined in file_umpire_strategy_mixins_Inspector.hpp

Inheritance Relationships

Derived Type

- private umpire::strategy::AllocationTracker (*Class AllocationTracker*)

Class Documentation

```
class umpire::strategy::mixins::Inspector  
Subclassed by umpire::strategy::AllocationTracker
```

Public Functions

```
Inspector()  
void registerAllocation(void *ptr, std::size_t size, strategy::AllocationStrategy *strategy)  
util::AllocationRecord deregisterAllocation(void *ptr, strategy::AllocationStrategy *strategy)
```

Protected Attributes

```
std::size_t m_current_size  
std::size_t m_high_watermark  
std::size_t m_allocation_count
```

Class MonotonicAllocationStrategy

- Defined in file_umpire_strategy_MonotonicAllocationStrategy.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::MonotonicAllocationStrategy : public umpire::strategy::AllocationStrategy
```

Public Functions

```
MonotonicAllocationStrategy (const std::string &name, int id, Allocator allocator, std::size_t capacity)
```

```
~MonotonicAllocationStrategy ()
```

```
void *allocate (std::size_t bytes) override  
    Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- `bytes`: Number of bytes to allocate.

```
void deallocate (void *ptr) override  
    Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
std::size_t getCurrentSize () const noexcept override  
    Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept override  
    Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of `getCurrentSize()`.

Return High watermark allocation size.

```
Platform getPlatform () noexcept override  
    Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()  
    Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize () const noexcept  
    Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept  
Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept  
Get the name of this AllocationStrategy.
```

Return The name of this *AllocationStrategy*.

```
int getId () noexcept  
Get the id of this AllocationStrategy.
```

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent () const noexcept  
Traces where the allocator came from.
```

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class NamedAllocationStrategy

- Defined in file_umpire_strategy_NamedAllocationStrategy.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::NamedAllocationStrategy : public umpire::strategy::AllocationStrategy
```

Public Functions

NamedAllocationStrategy (`const std::string &name, int id, Allocator allocator`)

`void *allocate (std::size_t bytes) override`
Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- `bytes`: Number of bytes to allocate.

`void deallocate (void *ptr) override`

Free the memory at `ptr`.

Parameters

- `ptr`: Pointer to free.

Platform `getPlatform () noexcept override`

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

MemoryResourceTraits `getTraits () const noexcept override`

`void release ()`

Release any and all unused memory held by this *AllocationStrategy*.

`std::size_t getCurrentSize () const noexcept`

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

`std::size_t getHighWatermark () const noexcept`

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize()`.

Return High watermark allocation size.

`std::size_t getActualSize () const noexcept`

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

`std::size_t getAllocationCount () const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
strategy::AllocationStrategy *m_allocator  
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class NumaPolicy

- Defined in file_umpire_strategy_NumaPolicy.hpp

Inheritance Relationships

Base Type

- public `umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::NumaPolicy : public umpire::strategy::AllocationStrategy
```

Use NUMA interface to locate memory to a specific NUMA node.

This *AllocationStrategy* provides a method of ensuring memory sits on a specific NUMA node. This can be used either for optimization, or for moving memory between the host and devices.

Public Functions

NumaPolicy (**const** std::string &*name*, int *id*, Allocator *allocator*, int *numa_node*)

void ***allocate** (std::size_t *bytes*) **override**
Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- *bytes*: Number of bytes to allocate.

void **deallocate** (void **ptr*) **override**

Free the memory at *ptr*.

Parameters

- *ptr*: Pointer to free.

Platform **getPlatform()** **noexcept override**

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

MemoryResourceTraits **getTraits()** **const noexcept override**

int **getNode()** **const noexcept**

void **release()**

Release any and all unused memory held by this *AllocationStrategy*.

std::size_t **getCurrentSize()** **const noexcept**

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

std::size_t **getHighWatermark()** **const noexcept**

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of *getCurrentSize*.

Return High watermark allocation size.

std::size_t **getActualSize()** **const noexcept**

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

std::size_t **getAllocationCount()** **const noexcept**

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId() noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent() const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name  
int m_id  
AllocationStrategy *m_parent
```

Class QuickPool

- Defined in file_umpire_strategy_QuickPool.hpp

Nested Relationships

Nested Types

- Struct* *QuickPool::Chunk*
- Template Class* *QuickPool::pool_allocator*

Inheritance Relationships

Base Types

- `public umpire::strategy::AllocationStrategy` (*Class AllocationStrategy*)
- `private umpire::strategy::mixins::AlignedAllocation` (*Class AlignedAllocation*)

Class Documentation

```
class umpire::strategy::QuickPool : public umpire::strategy::AllocationStrategy, private umpire::strategy::mixins::
```

Public Types

```
using Pointer = void*
using CoalesceHeuristic = std::function<bool (const strategy::QuickPool&) >
```

Public Functions

```
QuickPool(const std::string &name, int id, Allocator allocator, const std::size_t
          first_minimum_pool_allocation_size = (512 * 1024 * 1024), const std::size_t
          next_minimum_pool_allocation_size = (1 * 1024 * 1024), const std::size_t alignment = 16, CoalesceHeuristic should_coalesce = percent_releasable(100)) noexcept
Construct a new QuickPool.
```

Parameters

- name: Name of this instance of the *QuickPool*
- id: Unique identifier for this instance
- allocator: Allocation resource that pool uses
- first_minimum_pool_allocation_size: Size the pool initially allocates
- next_minimum_pool_allocation_size: The minimum size of all future allocations
- alignment: Number of bytes with which to align allocation sizes (power-of-2)
- should_coalesce: Heuristic for when to perform coalesce operation

```
~QuickPool()
```

```
QuickPool(const QuickPool&) = delete
```

```
void *allocate(std::size_t bytes) override
Allocate bytes of memory.
```

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate(void *ptr) override
Free the memory at ptr.
```

Parameters

- ptr: Pointer to free.

```
void release() override
Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getActualSize() const noexcept override
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getReleasableSize() const noexcept
```

```
Platform getPlatform() noexcept override
```

Get the platform associated with this `AllocationStrategy`.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this `AllocationStrategy`.

Return The platform associated with this `AllocationStrategy`.

```
MemoryResourceTraits getTraits() const noexcept override
```

```
std::size_t getBlocksInPool() const noexcept
```

Return the number of memory blocks both leased to application and internal free memory that the pool holds.

```
std::size_t getLargestAvailableBlock() noexcept
```

Get the largest allocatable number of bytes from pool before the pool will grow.

return The largest number of bytes that may be allocated without causing pool growth

```
void coalesce() noexcept
```

```
void do_coalesce() noexcept
```

```
std::size_t getCurrentSize() const noexcept
```

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this `AllocationStrategy` object.

Return Current total size of allocations.

```
std::size_t getHighWatermark() const noexcept
```

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
std::size_t getAllocationCount() const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName() noexcept
```

Get the name of this `AllocationStrategy`.

Return The name of this `AllocationStrategy`.

```
int getId() noexcept
```

Get the id of this `AllocationStrategy`.

Return The id of this *AllocationStrategy*.

AllocationStrategy ***getParent** () const noexcept
Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Public Static Functions

CoalesceHeuristic **percent_releasable** (int *percentage*)

Protected Attributes

std::string **m_name**
int **m_id**
AllocationStrategy ***m_parent**

Private Functions

std::size_t **aligned_round_up** (std::size_t *size*)
Round up the size to be an integral multiple of configured alignment.

Return Size rounded up to be integral multiple of configured alignment

void ***aligned_allocate** (const std::size_t *size*)
Return an allocation of *size* bytes that is aligned on the configured alignment boundary.
void **aligned_deallocate** (void **ptr*)
Deallocate previously alligned allocation.

Private Members

strategy::*AllocationStrategy* ***m_allocator**

Template Class QuickPool::pool_allocator

- Defined in file_umpire_strategy_QuickPool.hpp

Nested Relationships

This class is a nested type of *Class QuickPool*.

Class Documentation

```
template<typename Value>
class umpire::strategy::QuickPool::pool_allocator
```

Public Types

```
using value_type = Value
using size_type = std::size_t
using difference_type = std::ptrdiff_t

Class SizeLimiter

- Defined in file_umpire_strategy_SizeLimiter.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::SizeLimiter : public umpire::strategy::AllocationStrategy
    An allocator with a limited total size.
```

Using this *AllocationStrategy* with another can be a good way to limit the total size of allocations made on a particular resource or from a particular context.

Public Functions

SizeLimiter (**const** std::string &name, int id, *Allocator allocator*, std::size_t size_limit)

void ***allocate** (std::size_t bytes) **override**
Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

void **deallocate** (void *ptr) **override**

Free the memory at ptr.

Parameters

- ptr: Pointer to free.

Platform **getPlatform()** **noexcept override**

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

MemoryResourceTraits **getTraits()** **const noexcept override**

void **release()**

Release any and all unused memory held by this *AllocationStrategy*.

std::size_t **getCurrentSize()** **const noexcept**

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

std::size_t **getHighWatermark()** **const noexcept**

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of *getCurrentSize*.

Return High watermark allocation size.

std::size_t **getActualSize()** **const noexcept**

Get the current amount of memory allocated by this allocator.

Note that this can be larger than *getCurrentSize()*, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

std::size_t **getAllocationCount()** **const noexcept**

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId () noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

```
AllocationStrategy *getParent () const noexcept
```

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Class SlotPool

- Defined in file_umpire_strategy_SlotPool.hpp

Inheritance Relationships

Base Type

- public *umpire::strategy::AllocationStrategy* (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::SlotPool : public umpire::strategy::AllocationStrategy
```

Public Functions

```
SlotPool (const std::string &name, int id, Allocator allocator, std::size_t slots)
```

```
~SlotPool ()
```

```
void *allocate (std::size_t bytes) override
```

Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate (void *ptr) override
    Free the memory at ptr.
```

Parameters

- `ptr`: Pointer to free.

```
std::size_t getCurrentSize () const noexcept override
```

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept override
```

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
Platform getPlatform () noexcept override
```

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

```
MemoryResourceTraits getTraits () const noexcept override
```

```
void release ()
```

Release any and all unused memory held by this *AllocationStrategy*.

```
std::size_t getActualSize () const noexcept
```

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
std::size_t getAllocationCount () const noexcept
```

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept
```

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

```
int getId () noexcept
```

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

AllocationStrategy ***getParent () const noexcept**
Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Class ThreadSafeAllocator

- Defined in file_umpire_strategy_ThreadSafeAllocator.hpp

Inheritance Relationships

Base Type

- public *umpire::strategy::AllocationStrategy* (*Class AllocationStrategy*)

Class Documentation

class *umpire::strategy::ThreadSafeAllocator* : **public** *umpire::strategy::AllocationStrategy*
Make an *Allocator* thread safe.

Using this *AllocationStrategy* will make the provided allocator thread-safe by syncronizing access to the allocators interface.

Public Functions

ThreadSafeAllocator (**const** std::string &*name*, **int** *id*, *Allocator* *allocator*)

void ***allocate** (std::size_t *bytes*) **override**
Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- bytes*: Number of bytes to allocate.

void **deallocate** (void **ptr*) **override**
Free the memory at *ptr*.

Parameters

- ptr*: Pointer to free.

`Platform getPlatform() noexcept override`

Get the platform associated with this *AllocationStrategy*.

The Platform distinguishes the appropriate place to execute operations on memory allocated by this *AllocationStrategy*.

Return The platform associated with this *AllocationStrategy*.

`MemoryResourceTraits getTraits() const noexcept override`

`void release()`

Release any and all unused memory held by this *AllocationStrategy*.

`std::size_t getCurrentSize() const noexcept`

Get current (total) size of the allocated memory.

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

`std::size_t getHighWatermark() const noexcept`

Get the high watermark of the total allocated size.

This is equivalent to the highest observed value of `getCurrentSize()`.

Return High watermark allocation size.

`std::size_t getActualSize() const noexcept`

Get the current amount of memory allocated by this allocator.

Note that this can be larger than `getCurrentSize()`, particularly if the *AllocationStrategy* implements some kind of pooling.

Return The total size of all the memory this object has allocated.

`std::size_t getAllocationCount() const noexcept`

Get the total number of active allocations by this allocator.

Return The total number of active allocations this object has allocated.

`const std::string &getName() noexcept`

Get the name of this *AllocationStrategy*.

Return The name of this *AllocationStrategy*.

`int getId() noexcept`

Get the id of this *AllocationStrategy*.

Return The id of this *AllocationStrategy*.

`AllocationStrategy *getParent() const noexcept`

Traces where the allocator came from.

Return Pointer to the parent *AllocationStrategy*.

Protected Attributes

```
strategy::AllocationStrategy *m_allocator
std::mutex m_mutex
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Class ZeroByteHandler

- Defined in file_umpire_strategy_ZeroByteHandler.hpp

Inheritance Relationships

Base Type

- public umpire::strategy::AllocationStrategy (*Class AllocationStrategy*)

Class Documentation

```
class umpire::strategy::ZeroByteHandler : public umpire::strategy::AllocationStrategy
```

Public Functions

```
ZeroByteHandler(std::unique_ptr<AllocationStrategy> &&allocator) noexcept
void *allocate(std::size_t bytes) override
```

Allocate bytes of memory.

Return Pointer to start of allocated bytes.

Parameters

- bytes: Number of bytes to allocate.

```
void deallocate(void *ptr) override
Free the memory at ptr.
```

Parameters

- ptr: Pointer to free.

```
void release() override
Release any and all unused memory held by this AllocationStrategy.
```

```
std::size_t getCurrentSize() const noexcept override
Get current (total) size of the allocated memory.
```

This is the total size of all allocation currently ‘live’ that have been made by this *AllocationStrategy* object.

Return Current total size of allocations.

```
std::size_t getHighWatermark () const noexcept override  
Get the high watermark of the total allocated size.
```

This is equivalent to the highest observed value of `getCurrentSize`.

Return High watermark allocation size.

```
std::size_t getActualSize () const noexcept override  
Get the current amount of memory allocated by this allocator.
```

Note that this can be larger than `getCurrentSize()`, particularly if the `AllocationStrategy` implements some kind of pooling.

Return The total size of all the memory this object has allocated.

```
Platform getPlatform () noexcept override  
Get the platform associated with this AllocationStrategy.
```

The Platform distinguishes the appropriate place to execute operations on memory allocated by this `AllocationStrategy`.

Return The platform associated with this `AllocationStrategy`.

```
MemoryResourceTraits getTraits () const noexcept override  
strategy::AllocationStrategy *getAllocationStrategy ()  
std::size_t getAllocationCount () const noexcept  
Get the total number of active allocations by this allocator.
```

Return The total number of active allocations this object has allocated.

```
const std::string &getName () noexcept  
Get the name of this AllocationStrategy.
```

Return The name of this `AllocationStrategy`.

```
int getId () noexcept  
Get the id of this AllocationStrategy.
```

Return The id of this `AllocationStrategy`.

```
AllocationStrategy *getParent () const noexcept  
Traces where the allocator came from.
```

Return Pointer to the parent `AllocationStrategy`.

Protected Attributes

```
std::string m_name
int m_id
AllocationStrategy *m_parent
```

Template Class TypedAllocator

- Defined in file_umpire_TypedAllocator.hpp

Class Documentation

```
template<typename T>
class umpire::TypedAllocator
```

Allocator for objects of type T.

This class is an adaptor that allows using an *Allocator* to allocate objects of type T. You can use this class as an allocator for STL containers like std::vector.

Public Types

```
typedef T value_type
```

Public Functions

```
TypedAllocator(Allocator allocator)
```

Construct a new *TypedAllocator* that will use allocator to allocate data.

Parameters

- allocator: *Allocator* to use for allocating memory.

```
template<typename U>
TypedAllocator(const TypedAllocator<U> &other)
```

```
T *allocate(std::size_t size)
```

```
void deallocate(T *ptr, std::size_t size)
```

Deallocate ptr, the passed size is ignored.

Parameters

- ptr: Pointer to deallocate
- size: Size of allocation (ignored).

Friends

```
friend class TypedAllocator
```

Class AllocationMap

- Defined in file_umpire_util_AllocationMap.hpp

Nested Relationships

Nested Types

- Class AllocationMap::ConstIterator*
- Class AllocationMap::RecordList*
- Template Struct RecordList::Block*
- Class RecordList::ConstIterator*

Class Documentation

```
class umpire::util::AllocationMap
```

Public Types

```
using Map = MemoryMap<RecordList>
```

Public Functions

```
AllocationMap()
AllocationMap(const AllocationMap&) = delete
void insert(void *ptr, AllocationRecord record)
const AllocationRecord *find(void *ptr) const
AllocationRecord *find(void *ptr)
const AllocationRecord *findRecord(void *ptr) const noexcept
AllocationRecord *findRecord(void *ptr) noexcept
AllocationRecord remove(void *ptr)
bool contains(void *ptr) const
void clear()
std::size_t size() const
void print(const std::function<bool> &predicate, const AllocationRecord&
          > && predicate, std::ostream &os = std::cout) const
void printAll(std::ostream &os = std::cout) const
```

```
ConstIterator begin() const
ConstIterator end() const
class ConstIterator
```

Public Types

```
using iterator_category = std::forward_iterator_tag
using value_type = AllocationRecord
using difference_type = std::ptrdiff_t
using pointer = value_type*
using reference = value_type&
```

Public Functions

```
ConstIterator(const AllocationMap *map, iterator_begin)
ConstIterator(const AllocationMap *map, iterator_end)
ConstIterator(const ConstIterator&) = default
const AllocationRecord &operator*()
const AllocationRecord *operator->()
ConstIterator &operator++()
ConstIterator operator++(int)
bool operator==(const ConstIterator &other) const
bool operator!=(const ConstIterator &other) const
```

Class AllocationMap::ConstIterator

- Defined in file_umpire_util_AllocationMap.hpp

Nested Relationships

This class is a nested type of *Class AllocationMap*.

Class Documentation

```
class umpire::util::AllocationMap::ConstIterator
```

Public Types

```
using iterator_category = std::forward_iterator_tag
using value_type = AllocationRecord
using difference_type = std::ptrdiff_t
using pointer = value_type*
using reference = value_type&
```

Public Functions

```
ConstIterator(const AllocationMap *map, iterator_begin)
ConstIterator(const AllocationMap *map, iterator_end)
ConstIterator(const ConstIterator&) = default
const AllocationRecord &operator*()
const AllocationRecord *operator->()
ConstIterator &operator++()
ConstIterator operator++(int)
bool operator==(const ConstIterator &other) const
bool operator!=(const ConstIterator &other) const
```

Class AllocationMap::RecordList

- Defined in file_umpire_util_AllocationMap.hpp

Nested Relationships

This class is a nested type of *Class AllocationMap*.

Nested Types

- Template Struct RecordList::Block*
- Class RecordList::ConstIterator*

Class Documentation

```
class umpire::util::AllocationMap::RecordList
```

Public Types

```
using RecordBlock = Block<AllocationRecord>
```

Public Functions

```
RecordList (AllocationMap &map, AllocationRecord record)
~RecordList ()
void push_back (const AllocationRecord &rec)
AllocationRecord pop_back ()
ConstIterator begin () const
ConstIterator end () const
std::size_t size () const
bool empty () const
AllocationRecord *back ()
const AllocationRecord *back () const
template<typename T>
struct Block
```

Public Members

```
T rec
Block *prev
class ConstIterator
```

Public Types

```
using iterator_category = std::forward_iterator_tag
using value_type = AllocationRecord
using difference_type = std::ptrdiff_t
using pointer = value_type*
using reference = value_type&
```

Public Functions

```
ConstIterator()
ConstIterator (const RecordList *list, iterator_begin)
ConstIterator (const RecordList *list, iterator_end)
ConstIterator (const ConstIterator&) = default
const AllocationRecord &operator* ()
const AllocationRecord *operator-> ()
```

```
ConstIterator &operator++ ()  
ConstIterator operator++ (int)  
bool operator==(const ConstIterator &other) const  
bool operator!=(const ConstIterator &other) const
```

Class RecordList::ConstIterator

- Defined in file_umpire_util_AllocationMap.hpp

Nested Relationships

This class is a nested type of *Class AllocationMap::RecordList*.

Class Documentation

```
class umpire::util::AllocationMap::RecordList::ConstIterator
```

Public Types

```
using iterator_category = std::forward_iterator_tag  
using value_type = AllocationRecord  
using difference_type = std::ptrdiff_t  
using pointer = value_type*  
using reference = value_type&
```

Public Functions

```
ConstIterator()  
ConstIterator(const RecordList *list, iterator_begin)  
ConstIterator(const RecordList *list, iterator_end)  
ConstIterator(const ConstIterator&) = default  
const AllocationRecord &operator* ()  
const AllocationRecord *operator-> ()  
ConstIterator &operator++ ()  
ConstIterator operator++ (int)  
bool operator==(const ConstIterator &other) const  
bool operator!=(const ConstIterator &other) const
```

Class Exception

- Defined in file_umpire_util_Exception.hpp

Inheritance Relationships

Base Type

- public std::exception

Class Documentation

```
class umpire::util::Exception : public std::exception
```

Public Functions

```
Exception(const std::string &msg, const std::string &file, int line)
~Exception() = default
std::string message() const
const char *what() const
```

Class FixedMallocPool

- Defined in file_umpire_util_FixedMallocPool.hpp

Nested Relationships

Nested Types

- Struct FixedMallocPool::Pool*

Class Documentation

```
class umpire::util::FixedMallocPool
    Pool for fixed size allocations using malloc()
```

Another version of this class exists in `umpire::strategy`, but this version does not rely on `Allocator` and all the memory tracking statistics, so it is useful for building objects in `umpire::util`.

Public Functions

```
FixedMallocPool (const std::size_t object_bytes, const std::size_t objects_per_pool = 1024 *  
1024)  
~FixedMallocPool ()  
void *allocate (std::size_t bytes = 0)  
void deallocate (void *ptr)  
std::size_t numPools () const noexcept
```

Class Logger

- Defined in file_umpire_util_LOGGER.hpp

Class Documentation

```
class umpire::util::Logger
```

Public Functions

```
void setLoggingMsgLevel (message::Level level) noexcept  
void logMessage (message::Level level, const std::string &message, const std::string &fileName,  
int line) noexcept  
bool logLevelEnabled (message::Level level)  
~Logger () noexcept = default  
Logger (const Logger&) = delete  
Logger &operator= (const Logger&) = delete
```

Public Static Functions

```
void initialize ()  
void finalize ()  
Logger *getActiveLogger ()
```

Template Class MemoryMap

- Defined in file_umpire_util_MemoryMap.hpp

Nested Relationships

Nested Types

- *Template Class MemoryMap::Iterator_*

Class Documentation

```
template<typename V>
class umpire::util::MemoryMap
A fast replacement for std::map<void*,Value> for a generic Value.
```

This uses *FixedMAllocPool* and Judy arrays and provides forward const and non-const iterators.

Public Types

```
using Key = void*
using Value = V
using KeyValuePair = std::pair<Key, Value*>
using Iterator = Iterator_<false>
using ConstIterator = Iterator_<true>
```

Public Functions

```
MemoryMap()
~MemoryMap()
```

```
MemoryMap(const MemoryMap&) = delete
std::pair<Iterator, bool> insert (Key ptr, const Value &val) noexcept
Insert Value at ptr in the map if ptr does not exist. Uses copy constructor on Value once.
```

Return Pair of iterator position into map and boolean value whether entry was added. The iterator will be set to *end()* if no insertion was made.

```
template<typename P>
std::pair<Iterator, bool> insert (P &&pair) noexcept
Insert a key-value pair if pair.first does not exist as a key. Must have first and second fields. Calls the first version.
```

Return See alternative version.

```
template<typename ...Args>
std::pair<Iterator, bool> insert (Key ptr, Args&&... args) noexcept
Emplaces a new value at ptr in the map, forwarding args to the placement new constructor.
```

Return See alternative version.

```
Iterator findOrBefore (Key ptr) noexcept
Find a value at ptr.
```

Return iterator into map at ptr or preceding position.

ConstIterator **findOrBefore** (*Key* *ptr*) **const noexcept**

Iterator **find** (*Key* *ptr*) **noexcept**

Find a value at ptr.

Return iterator into map at ptr or *end()* if not found.

ConstIterator **find** (*Key* *ptr*) **const noexcept**

ConstIterator **begin** () **const**

Iterator to first value or *end()* if empty.

Iterator **begin** ()

ConstIterator **end** () **const**

Iterator to one-past-last value.

Iterator **end** ()

void **erase** (*Key* *ptr*)

Remove an entry from the map.

void **erase** (*Iterator* *iter*)

void **erase** (*ConstIterator* *oter*)

void **removeLast** ()

Remove/deallocate the last found entry.

WARNING: Use this with caution, only directly after using a method above. *erase(Key)* is safer, but requires an additional lookup.

void **clear** () **noexcept**

Clear all entries from the map.

std::size_t **size** () **const noexcept**

Return number of entries in the map.

template<typename ...**Args**>

std::pair<typename *MemoryMap*<*V*>::*Iterator*, **bool**> **doInsert** (*Key* *ptr*, *Args*&&... *args*) **noexcept**

template<typename **P**>

std::pair<typename *MemoryMap*<*V*>::*Iterator*, **bool**> **insert** (*P* &&*pair*) **noexcept**

template<typename ...**Args**>

std::pair<typename *MemoryMap*<*V*>::*Iterator*, **bool**> **insert** (*Key* *ptr*, *Args*&&... *args*) **noexcept**

Friends

friend class *Iterator_*

template<bool **Const** = false>

class *Iterator_*

Public Types

std::shared_ptr<Statistic> getStatistic(const std::string &name)
void printStatistics(std::ostream &stream) noexcept
```

Public Static Functions

StatisticsDatabase ***getDatabase()**

6.3.3 Enums

Enum MemoryResourceType

- Defined in file_umpire_resource_MemoryResourceTypes.hpp

Enum Documentation

enum *umpire::resource::MemoryResourceType*

Values:

```
enumerator Host
enumerator Device
enumerator Unified
enumerator Pinned
enumerator Constant
enumerator File
enumerator Unknown
```

Enum Level

- Defined in file_umpire_util_LOGGER.hpp

Enum Documentation

enum *umpire::util::message::Level*

Values:

```
enumerator Error
enumerator Warning
enumerator Info
enumerator Debug
enumerator Num_Levels
```

6.3.4 Functions

Function `find_first_set`

- Defined in file_umpire_strategy_FixedSizePool.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “`find_first_set`” with arguments (int) in doxygen xml output for project “umpire” from directory: `../doxygen/xml/`. Potential matches:

```
- int find_first_set(int i)
```

Function `genumpiresplicer::gen_bounds`

- Defined in file_umpire_interface_c_fortran_genumpiresplicer.py

Function Documentation

```
genumpiresplicer.gen_bounds()
```

Function `genumpiresplicer::gen_fortran`

- Defined in file_umpire_interface_c_fortran_genumpiresplicer.py

Function Documentation

```
genumpiresplicer.gen_fortran()
```

Function `genumpiresplicer::gen_methods`

- Defined in file_umpire_interface_c_fortran_genumpiresplicer.py

Function Documentation

```
genumpiresplicer.gen_methods()
```

Function ShroudStrToArray(umpire_SHROUD_array *, const std::string *, int)

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

Warning: doxygenfunction: Cannot find function “ShroudStrToArray” in doxygen xml output for project “umpire” from directory: ../doxygen/xml/

Function ShroudStrToArray(umpire_SHROUD_array *, const std::string *, int)

- Defined in file_umpire_interface_c_fortran_wrapUmpire.cpp

Function Documentation

Warning: doxygenfunction: Cannot find function “ShroudStrToArray” in doxygen xml output for project “umpire” from directory: ../doxygen/xml/

Function umpire::cpu_vendor_type

- Defined in file_umpire_util_detect_vendor.cpp

Function Documentation

MemoryResourceTraits::vendor_type **umpire::cpu_vendor_type () noexcept**

Function umpire::error

- Defined in file_umpire_util_io.cpp

Function Documentation

std::ostream &umpire::error ()

Function umpire::finalize

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
void umpire::finalize()
```

Function `umpire::free`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
void umpire::free(void *ptr)
```

Free any memory allocated with Umpire.

This method is a convenience wrapper around calls to the [ResourceManager](#), it can be used to free allocations from any MemorySpace. *

Parameters

- ptr: Address to free.

Function `umpire::get_allocator_records`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
std::vector<util::AllocationRecord> umpire::get_allocator_records(Allocator allocator)
```

Returns vector of AllocationRecords created by the allocator.

Parameters

- allocator: source [Allocator](#).

Function `umpire::get_backtrace`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
std::string umpire::get_backtrace(void *ptr)
```

Get the backtrace associated with the allocation of ptr.

The string may be empty if backtraces are not enabled.

Function `umpire::get_device_memory_usage`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
std::size_t umpire::get_device_memory_usage(int device_id)
```

Get memory usage of device *device_id*, using appropriate underlying vendor API.

Function `umpire::get_leaked_allocations`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
std::vector<util::AllocationRecord> umpire::get_leaked_allocations(Allocator allocator)
```

Get all the leaked (active) allocations associated with allocator.

Function `umpire::get_major_version`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
int umpire::get_major_version()
```

Function `umpire::get_minor_version`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
int umpire::get_minor_version()
```

Function `umpire::get_page_size`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
long umpire::get_page_size()
```

Function `umpire::get_patch_version`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
int umpire::get_patch_version()
```

Function `umpire::get_process_memory_usage`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
std::size_t umpire::get_process_memory_usage()
```

Get memory usage of the current process (uses underlying system-dependent calls)

Function `umpire::get_rc_version`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
std::string umpire::get_rc_version()
```

Function `umpire::initialize`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
void umpire::initialize()
```

Function `umpire::log`

- Defined in file_umpire_util_io.cpp

Function Documentation

```
std::ostream &umpire::log()
```

Function `umpire::malloc`

- Defined in file_umpire_Umpire.hpp

Function Documentation

```
void *umpire::malloc(std::size_t size)
```

Allocate memory in the default space, with the default allocator.

This method is a convenience wrapper around calls to the *ResourceManager* to allocate memory in the default MemorySpace.

Parameters

- `size`: Number of bytes to allocate.

Function `umpire::numa::get_allocatable_nodes`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
std::vector<int> umpire::numa::get_allocatable_nodes()
```

Function `umpire::numa::get_device_nodes`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
std::vector<int> umpire::numa::get_device_nodes()
```

Function `umpire::numa::get_host_nodes`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
std::vector<int> umpire::numa::get_host_nodes()
```

Function `umpire::numa::get_location`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
int umpire::numa::get_location(void *ptr)
```

Function `umpire::numa::move_to_node`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
void umpire::numa::move_to_node(void *ptr, std::size_t bytes, int node)
```

Function `umpire::numa::preferred_node`

- Defined in file_umpire_util_numa.cpp

Function Documentation

```
int umpire::numa::preferred_node()
```

Function `umpire::operator<<(std::ostream&, const Allocator&)`

- Defined in file_umpire_Allocator.cpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::operator<<” with arguments (std::ostream&, const Allocator&) in doxygen xml output for project “umpire” from directory:/doxygen/xml/. Potential matches:

```
- std::ostream &operator<<(std::ostream &os, const Allocator &allocator)

  ↳umpire::strategy::QuickPool::CoalesceHeuristic&)
```

Function `umpire::operator<<(std::ostream&, umpire::strategy::QuickPool::CoalesceHeuristic&)`

- Defined in file_umpire_Replay.cpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::operator<<” with arguments (std::ostream&, umpire::strategy::QuickPool::CoalesceHeuristic&) in doxygen xml output for project “umpire” from directory: ./doxygen/xml/. Potential matches:

```
- std::ostream &operator<<(std::ostream &os, const Allocator &allocator)
- std::ostream &operator<<(std::ostream &out, umpire::Allocator &alloc)
- std::ostream &operator<<(std::ostream &out, const
  ↳umpire::strategy::DynamicPoolList::CoalesceHeuristic&)
- std::ostream &operator<<(std::ostream &out, const
  ↳umpire::strategy::DynamicPoolMap::CoalesceHeuristic&)
- std::ostream &operator<<(std::ostream &out, const
  ↳umpire::strategy::QuickPool::CoalesceHeuristic&)
```

Function `umpire::pointer_contains`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
bool umpire::pointer_contains(void *left, void *right)
```

Check whether the left allocation contains the right.

right is contained by left if right is greater than left, and right+size is greater than left+size.

Parameters

- `left`: Pointer to left allocation
- `right`: Poniter to right allocation

Function `umpire::pointer_overlaps`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
bool umpire::pointer_overlaps(void *left, void *right)
```

Check whether the right allocation overlaps the left.

right will overlap left if the right is greater than left, but less than left+size, and right+size is strictly greater than left+size.

Parameters

- `left`: Pointer to left allocation
- `right`: Poniter to right allocation

Function `umpire::print_allocator_records`

- Defined in file_umpire_Umpire.cpp

Function Documentation

```
void umpire::print_allocator_records(Allocator allocator, std::ostream &os = std::cout)
```

Print the allocations from a specific allocator in a human-readable format.

Parameters

- `allocator`: source *Allocator*.
- `os`: output stream

Function `umpire::replay`

- Defined in `file_umpire_util_io.cpp`

Function Documentation

```
std::ostream &umpire::replay()
```

Function `umpire::resource::resource_to_device_id`

- Defined in `file_umpire_resource_MemoryResourceTypes.hpp`

Function Documentation

```
int umpire::resource::resource_to_device_id(const std::string &resource)
```

Function `umpire::resource::resource_to_string`

- Defined in `file_umpire_resource_MemoryResourceTypes.hpp`

Function Documentation

```
std::string umpire::resource::resource_to_string(MemoryResourceType type)
```

Function `umpire::resource::string_to_resource`

- Defined in `file_umpire_resource_MemoryResourceTypes.hpp`

Function Documentation

```
MemoryResourceType umpire::resource::string_to_resource(const std::string &resource)
```

Function `umpire::strategy::find_first_set`

- Defined in `file_umpire_strategy_FixedPool.cpp`

Function Documentation

```
int umpire::strategy::find_first_set(int i)
```

Function `umpire::strategy::operator<<`

- Defined in file_umpire_strategy_AllocationStrategy.cpp

Function Documentation

```
std::ostream &umpire::strategy::operator<< (std::ostream &os, const AllocationStrategy &strategy)
```

Function `umpire::util::case_insensitive_match`

- Defined in file_umpire_util_LOGGER.cpp

Function Documentation

```
int umpire::util::case_insensitive_match (const std::string s1, const std::string s2)
```

Function `umpire::util::detail::add_entry(conduit::Node&)`

- Defined in file_umpire_util_statistic_helper.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::util::detail::add_entry” with arguments (conduit::Node&) in doxygen xml output for project “umpire” from directory:/doxygen/xml/. Potential matches:

```
- conduit::Node add_entry(conduit::Node &n)
- template<typename T, typename U, typename ...Args> conduit::Node add_
  ↵entry(conduit::Node &n, T k, U v, Args... args)
- template<typename T, typename U> conduit::Node add_entry(conduit::Node &n, T k, U
  ↵v)
```

Template Function `umpire::util::detail::add_entry(conduit::Node&, T, U)`

- Defined in file_umpire_util_statistic_helper.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::util::detail::add_entry” with arguments (conduit::Node&, T, U) in doxygen xml output for project “umpire” from directory:/doxygen/xml/. Potential matches:

```
- conduit::Node add_entry(conduit::Node &n)
- template<typename T, typename U, typename ...Args> conduit::Node add_
  ↪entry(conduit::Node &n, T k, U v, Args... args)
- template<typename T, typename U> conduit::Node add_entry(conduit::Node &n, T k, U_
  ↪v)
```

Template Function `umpire::util::detail::add_entry(conduit::Node&, T, U, Args...)`

- Defined in file_umpire_util_statistic_helper.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::util::detail::add_entry” with arguments (conduit::Node&, T, U, Args...) in doxygen xml output for project “umpire” from directory: ./doxygen/xml/. Potential matches:

```
- conduit::Node add_entry(conduit::Node &n)
- template<typename T, typename U, typename ...Args> conduit::Node add_
  ↪entry(conduit::Node &n, T k, U v, Args... args)
- template<typename T, typename U> conduit::Node add_entry(conduit::Node &n, T k, U_
  ↪v)
```

Template Function `umpire::util::detail::record_statistic`

- Defined in file_umpire_util_statistic_helper.hpp

Function Documentation

```
template<typename ...Args>
void umpire::util::detail::record_statistic(const std::string &name, Args&&... args)
```

Function `umpire::util::directory_exists`

- Defined in file_umpire_util_io.cpp

Function Documentation

```
bool umpire::util::directory_exists(const std::string &file)
```

Template Function `umpire::util::do_wrap(std::unique_ptr<Base>&&)`

- Defined in file_umpire_util_wrap_allocator.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::util::do_wrap” with arguments (std::unique_ptr<Base>&&) in doxygen xml output for project “umpire” from directory:/doxygen/xml/.
Potential matches:

```
- template<typename Base, typename Strategy, typename ...Strategies> std::unique_ptr
  ↳<Base> do_wrap(std::unique_ptr<Base> &&allocator)
- template<typename Base> std::unique_ptr<Base> do_wrap(std::unique_ptr<Base> &&
  ↳allocator)
```

Template Function `umpire::util::do_wrap(std::unique_ptr<Base>&&)`

- Defined in file_umpire_util_wrap_allocator.hpp

Function Documentation

Warning: doxygenfunction: Unable to resolve multiple matches for function “umpire::util::do_wrap” with arguments (std::unique_ptr<Base>&&) in doxygen xml output for project “umpire” from directory:/doxygen/xml/.
Potential matches:

```
- template<typename Base, typename Strategy, typename ...Strategies> std::unique_ptr
  ↳<Base> do_wrap(std::unique_ptr<Base> &&allocator)
- template<typename Base> std::unique_ptr<Base> do_wrap(std::unique_ptr<Base> &&
  ↳allocator)
```

Function `umpire::util::file_exists`

- Defined in file_umpire_util_io.cpp

Function Documentation

```
bool umpire::util::file_exists(const std::string &file)
```

Function `umpire::util::flush_files`

- Defined in `file_umpire_util_io.cpp`

Function Documentation

```
void umpire::util::flush_files()
```

Synchronize all stream buffers to their respective output sequences. This function is usually called by exception generating code like UMPIRE_ERROR.

Function `umpire::util::initialize_io`

- Defined in `file_umpire_util_io.cpp`

Function Documentation

```
void umpire::util::initialize_io (const bool enable_log, const bool enable_replay)
```

Initialize the streams. This method is called when ResourceManger is initialized. Do not call this manually.

Template Function `umpire::util::make_unique`

- Defined in `file_umpire_util_make_unique.hpp`

Function Documentation

```
template<typename T, typename ...Args>
```

```
constexpr std::unique_ptr<T> umpire::util::make_unique (Args&&... args)
```

Function `umpire::util::make_unique_filename`

- Defined in `file_umpire_util_io.cpp`

Function Documentation

```
std::string umpire::util::make_unique_filename (const std::string &base_dir, const std::string &name, const int pid, const std::string &extension)
```

Function `umpire::util::relative_fragmentation`

- Defined in file_umpire_util_allocation_statistics.cpp

Function Documentation

```
float umpire::util::relative_fragmentation(std::vector<util::AllocationRecord> &recs)
```

Compute the relative fragmentation of a set of allocation records.

Fragmentation = 1 - (largest free block) / (total free space)

Template Function `umpire::util::unwrap_allocation_strategy`

- Defined in file_umpire_util_wrap_allocator.hpp

Function Documentation

```
template<typename Strategy>
```

```
Strategy *umpire::util::unwrap_allocation_strategy(strategy::AllocationStrategy  
*base_strategy)
```

Template Function `umpire::util::unwrap_allocator`

- Defined in file_umpire_util_wrap_allocator.hpp

Function Documentation

```
template<typename Strategy>
```

```
Strategy *umpire::util::unwrap_allocator(Allocator allocator)
```

Template Function `umpire::util::wrap_allocator`

- Defined in file_umpire_util_wrap_allocator.hpp

Function Documentation

```
template<typename ...Strategies>
```

```
std::unique_ptr<strategy::AllocationStrategy> umpire::util::wrap_allocator(std::unique_ptr<strategy::AllocationStrategy>  
&&allocator)
```

Function `umpire_allocator_allocate(umpire_allocator *, size_t)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
void *umpire_allocator_allocate(umpire_allocator *self, size_t bytes)
```

Function `umpire_allocator_allocate(umpire_allocator *, size_t)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
void *umpire_allocator_allocate(umpire_allocator *self, size_t bytes)
```

Function `umpire_allocator_deallocate(umpire_allocator *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
void umpire_allocator_deallocate(umpire_allocator *self, void *ptr)
```

Function `umpire_allocator_deallocate(umpire_allocator *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
void umpire_allocator_deallocate(umpire_allocator *self, void *ptr)
```

Function `umpire_allocator_delete(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
void umpire_allocator_delete(umpire_allocator *self)
```

Function `umpire_allocator_delete(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
void umpire_allocator_delete(umpire_allocator *self)
```

Function `umpire_allocator_get_actual_size(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_actual_size(umpire_allocator *self)
```

Function `umpire_allocator_get_actual_size(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_actual_size(umpire_allocator *self)
```

Function `umpire_allocator_get_allocation_count(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_allocation_count(umpire_allocator *self)
```

Function `umpire_allocator_get_allocation_count(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_allocation_count(umpire_allocator *self)
```

Function `umpire_allocator_get_current_size(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_current_size(umpire_allocator *self)
```

Function `umpire_allocator_get_current_size(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_current_size(umpire_allocator *self)
```

Function `umpire_allocator_get_high_watermark(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_high_watermark(umpire_allocator *self)
```

Function `umpire_allocator_get_high_watermark(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_high_watermark(umpire_allocator *self)
```

Function `umpire_allocator_get_id(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_id(umpire_allocator *self)
```

Function `umpire_allocator_get_id(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_id(umpire_allocator *self)
```

Function `umpire_allocator_get_name(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
const char *umpire_allocator_get_name(umpire_allocator *self)
```

Function `umpire_allocator_get_name(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
const char *umpire_allocator_get_name(umpire_allocator *self)
```

Function `umpire_allocator_get_name_bufferify(umpire_allocator *, umpire_SHROUD_array *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
void umpire_allocator_get_name_bufferify(umpire_allocator *self, umpire_SHROUD_array  
*DSHF_rv)
```

Function `umpire_allocator_get_name_bufferify(umpire_allocator *, umpire_SHROUD_array *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
void umpire_allocator_get_name_bufferify(umpire_allocator *self, umpire_SHROUD_array  
*DSHF_rv)
```

Function `umpire_allocator_get_size(umpire_allocator *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
size_t umpire_allocator_get_size(umpire_allocator *self, void *ptr)
```

Function `umpire_allocator_get_size(umpire_allocator *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
size_t umpire_allocator_get_size(umpire_allocator *self, void *ptr)
```

Function `umpire_allocator_release(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.cpp

Function Documentation

```
void umpire_allocator_release(umpire_allocator *self)
```

Function `umpire_allocator_release(umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapAllocator.h

Function Documentation

```
void umpire_allocator_release(umpire_allocator *self)
```

Function `umpire_get_backtrace_bufferify(void *, umpire_SHROUD_array *)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.cpp

Function Documentation

```
void umpire_get_backtrace_bufferify(void *ptr, umpire_SHROUD_array *DSHF_rv)
```

Function `umpire_get_backtrace_bufferify(void *, umpire_SHROUD_array *)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.h

Function Documentation

```
void umpire_get_backtrace_bufferify(void *ptr, umpire_SHROUD_array *DSHF_rv)
```

Function `umpire_get_device_memory_usage(int)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.cpp

Function Documentation

```
size_t umpire_get_device_memory_usage(int device_id)
```

Function `umpire_get_device_memory_usage(int)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.h

Function Documentation

```
size_t umpire_get_device_memory_usage(int device_id)
```

Function `umpire_get_process_memory_usage(void)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.cpp

Function Documentation

```
size_t umpire_get_process_memory_usage(void)
```

Function `umpire_get_process_memory_usage(void)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.h

Function Documentation

```
size_t umpire_get_process_memory_usage(void)
```

Function `umpire_mod::allocator_allocate`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
type(c_ptr) function umpire_mod::allocator_allocate (obj, bytes)
```

Function `umpire_mod::allocator_allocate_double_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_double_array_1d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_double_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_double_array_2d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_double_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_double_array_3d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_double_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_double_array_4d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_float_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_float_array_1d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_float_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_float_array_2d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_float_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_float_array_3d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_float_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_float_array_4d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_int_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_int_array_1d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_int_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_int_array_2d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_int_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_int_array_3d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_int_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_int_array_4d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_long_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_long_array_1d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_long_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_long_array_2d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_long_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_long_array_3d (this, array, dims)
```

Function `umpire_mod::allocator_allocate_long_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_allocate_long_array_4d (this, array, dims)
```

Function `umpire_mod::allocator_associated`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
logical function umpire_mod::allocator_associated (obj)
```

Function `umpire_mod::allocator_deallocate`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate (obj, ptr)
```

Function `umpire_mod::allocator_deallocate_double_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_double_array_1d (this, array)
```

Function `umpire_mod::allocator_deallocate_double_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_double_array_2d (this, array)
```

Function `umpire_mod::allocator_deallocate_double_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_double_array_3d (this, array)
```

Function `umpire_mod::allocator_deallocate_double_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_double_array_4d (this, array)
```

Function `umpire_mod::allocator_deallocate_float_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_float_array_1d (this, array)
```

Function `umpire_mod::allocator_deallocate_float_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_float_array_2d (this, array)
```

Function `umpire_mod::allocator_deallocate_float_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_float_array_3d (this, array)
```

Function `umpire_mod::allocator_deallocate_float_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_float_array_4d (this, array)
```

Function `umpire_mod::allocator_deallocate_int_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_int_array_1d (this, array)
```

Function `umpire_mod::allocator_deallocate_int_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_int_array_2d (this, array)
```

Function `umpire_mod::allocator_deallocate_int_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_int_array_3d (this, array)
```

Function `umpire_mod::allocator_deallocate_int_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_int_array_4d (this, array)
```

Function `umpire_mod::allocator_deallocate_long_array_1d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_long_array_1d (this, array)
```

Function `umpire_mod::allocator_deallocate_long_array_2d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_long_array_2d (this, array)
```

Function `umpire_mod::allocator_deallocate_long_array_3d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_long_array_3d (this, array)
```

Function `umpire_mod::allocator_deallocate_long_array_4d`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_deallocate_long_array_4d (this, array)
```

Function `umpire_mod::allocator_delete`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_delete (obj)
```

Function `umpire_mod::allocator_eq`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
logical function umpire_mod::allocator_eq (a, b)
```

Function `umpire_mod::allocator_get_actual_size`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_actual_size (obj)
```

Function `umpire_mod::allocator_get_allocation_count`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_allocation_count (obj)
```

Function `umpire_mod::allocator_get_current_size`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_current_size (obj)
```

Function `umpire_mod::allocator_get_high_watermark`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_high_watermark (obj)
```

Function `umpire_mod::allocator_get_id`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_id (obj)
```

Function `umpire_mod::allocator_get_instance`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
type(c_ptr) function umpire_mod::allocator_get_instance (obj)
```

Function `umpire_mod::allocator_get_name`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
character(len=:) function, allocatable umpire_mod::allocator_get_name (obj)
```

Function `umpire_mod::allocator_get_size`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::allocator_get_size (obj, ptr)
```

Function `umpire_mod::allocator_ne`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
logical function umpire_mod::allocator_ne (a, b)
```

Function `umpire_mod::allocator_release`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_release (obj)
```

Function `umpire_mod::allocator_set_instance`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
subroutine umpire_mod::allocator_set_instance (obj, cxxmem)
```

Function `umpire_mod::get_backtrace`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
character(len=:) function, allocatable umpire_mod::get_backtrace (ptr)
```

Function `umpire_mod::pointer_contains`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
logical function umpire_mod::pointer_contains (left, right)
```

Function `umpire_mod::pointer_overlaps`

- Defined in file_umpire_interface_c_fortran_wrapfumpire.f

Function Documentation

```
logical function umpire_mod::pointer_overlaps (left, right)
```

Function `umpire_mod::resourcemanager_associated`

- Defined in file_umpire_interface_c_fortran_wrapfumpire.f

Function Documentation

```
logical function umpire_mod::resourcemanager_associated (obj)
```

Function `umpire_mod::resourcemanager_copy_all`

- Defined in file_umpire_interface_c_fortran_wrapfumpire.f

Function Documentation

```
subroutine umpire_mod::resourcemanager_copy_all (obj, src_ptr, dst_ptr)
```

Function `umpire_mod::resourcemanager_copy_with_size`

- Defined in file_umpire_interface_c_fortran_wrapfumpire.f

Function Documentation

```
subroutine umpire_mod::resourcemanager_copy_with_size (obj, src_ptr, dst_ptr, size)
```

Function `umpire_mod::resourcemanager_deallocate`

- Defined in file_umpire_interface_c_fortran_wrapfumpire.f

Function Documentation

```
subroutine umpire_mod::resourcemanager_deallocate (obj, ptr)
```

Function `umpire_mod::resourcemanager_eq`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
logical function umpire_mod::resourcemanager_eq (a, b)
```

Function `umpire_mod::resourcemanager_get_allocator_by_id`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_get_allocator_by_id (obj, id)
```

Function `umpire_mod::resourcemanager_get_allocator_by_name`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_get_allocator_by_name (obj, name)
```

Function `umpire_mod::resourcemanager_get_allocator_for_ptr`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_get_allocator_for_ptr (obj, ptr)
```

Function `umpire_mod::resourcemanager_get_instance`

- Defined in `file_umpire_interface_c_fortran_wrapfumpire.f`

Function Documentation

```
type(umpireresourcemanager) function umpire_mod::resourcemanager_get_instance ()
```

Function `umpire_mod::resourcemanager_get_size`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
integer(c_size_t) function umpire_mod::resourcemanager_get_size (obj, ptr)
```

Function `umpire_mod::resourcemanager_has_allocator`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
logical function umpire_mod::resourcemanager_has_allocator (obj, ptr)
```

Function `umpire_mod::resourcemanager_is_allocator`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
logical function umpire_mod::resourcemanager_is_allocator (obj, name)
```

Function `umpire_mod::resourcemanager_make_allocator_advisor`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_advisor (obj, na
```

Function `umpire_mod::resourcemanager_make_allocator_fixed_pool`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_fixed_pool (obj,
```

Function `umpire_mod::resourcemanager_make_allocator_list_pool`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_list_pool (obj, n
```

Function `umpire_mod::resourcemanager_make_allocator_named`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_named (obj, name,
```

Function `umpire_mod::resourcemanager_make_allocator_pool`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_pool (obj, name,
```

Function `umpire_mod::resourcemanager_make_allocator_prefetcher`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_prefetcher (obj,
```

Function `umpire_mod::resourcemanager_make_allocator_quick_pool`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_quick_pool (obj,
```

Function `umpire_mod::resourcemanager_make_allocator_thread_safe`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(umpireallocator) function umpire_mod::resourcemanager_make_allocator_thread_safe (obj)
```

Function `umpire_mod::resourcemanager_memset_all`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
subroutine umpire_mod::resourcemanager_memset_all (obj, ptr, val)
```

Function `umpire_mod::resourcemanager_memset_with_size`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
subroutine umpire_mod::resourcemanager_memset_with_size (obj, ptr, val, length)
```

Function `umpire_mod::resourcemanager_move`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
type(c_ptr) function umpire_mod::resourcemanager_move (obj, src_ptr, allocator)
```

Function `umpire_mod::resourcemanager_ne`

- Defined in file_umpire_interface_c_fortran_wrapumpire.f

Function Documentation

```
logical function umpire_mod::resourcemanager_ne (a, b)
```

Function `umpire_mod::resourcemanager_reallocate_default`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
type(c_ptr) function umpire_mod::resourcemanager_reallocate_default (obj, src_ptr, size)
```

Function `umpire_mod::resourcemanager_reallocate_with_allocator`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
type(c_ptr) function umpire_mod::resourcemanager_reallocate_with_allocator (obj, src_ptr, s
```

Function `umpire_mod::resourcemanager_register_allocator`

- Defined in `file_umpire_interface_c_fortran_wrapumpire.f`

Function Documentation

```
subroutine umpire_mod::resourcemanager_register_allocator (obj, name, allocator)
```

Function `umpire_pointer_contains(void *, void *)`

- Defined in `file_umpire_interface_c_fortran_wrapUmpire.cpp`

Function Documentation

```
bool umpire_pointer_contains (void *left, void *right)
```

Function `umpire_pointer_contains(void *, void *)`

- Defined in `file_umpire_interface_c_fortran_wrapUmpire.h`

Function Documentation

```
bool umpire_pointer_contains (void *left, void *right)
```

Function `umpire_pointer_overlaps(void *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.cpp

Function Documentation

```
bool umpire_pointer_overlaps (void *left, void *right)
```

Function `umpire_pointer_overlaps(void *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapUmpire.h

Function Documentation

```
bool umpire_pointer_overlaps (void *left, void *right)
```

Function `umpire_resourcemanager_copy_all(umpire_resourcemanager *, void *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
void umpire_resourcemanager_copy_all (umpire_resourcemanager *self, void *src_ptr, void *dst_ptr)
```

Function `umpire_resourcemanager_copy_all(umpire_resourcemanager *, void *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
void umpire_resourcemanager_copy_all (umpire_resourcemanager *self, void *src_ptr, void *dst_ptr)
```

Function `umpire_resourcemanager_copy_with_size(umpire_resourcemanager *, void *, void *, size_t)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
void umpire_resourcemanager_copy_with_size(umpire_resourcemanager *self, void *src_ptr,  
void *dst_ptr, size_t size)
```

Function *umpire_resourcemanager_copy_with_size*(*umpire_resourcemanager* *, void *, void *, *size_t*)

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
void umpire_resourcemanager_copy_with_size(umpire_resourcemanager *self, void *src_ptr,  
void *dst_ptr, size_t size)
```

Function *umpire_resourcemanager_deallocate*(*umpire_resourcemanager* *, void *)

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
void umpire_resourcemanager_deallocate(umpire_resourcemanager *self, void *ptr)
```

Function *umpire_resourcemanager_deallocate*(*umpire_resourcemanager* *, void *)

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
void umpire_resourcemanager_deallocate(umpire_resourcemanager *self, void *ptr)
```

Function *umpire_resourcemanager_get_allocator_by_id*(*umpire_resourcemanager* *, const int, *umpire_allocator* *)

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_id(umpire_resourcemanager  
*self, const int id, umpire_allocator *SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_by_id(umpire_resourcemanager *, const int, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_id(umpire_resourcemanager
    *self, const int id, umpire_allocator *SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_by_name(umpire_resourcemanager *, const char *, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_name(umpire_resourcemanager
    *self, const
    char *name, um-
    pire_allocator
    *SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_by_name(umpire_resourcemanager *, const char *, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_name(umpire_resourcemanager
    *self, const
    char *name, um-
    pire_allocator
    *SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_by_name_bufferify(umpire_resourcemanager *, const char *, int, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_name_bufferify(umpire_resourcemanager
*self,
const
char
*name,
int
Lname,
um-
pire_allocator
*SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_by_name_bufferify(umpire_resourcemanager *, const char *, int, umpire_allocator *)`

- Defined in `file_umpire_interface_c_fortran_wrapResourceManager.h`

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_by_name_bufferify(umpire_resourcemanager
*self,
const
char
*name,
int
Lname,
um-
pire_allocator
*SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_for_ptr(umpire_resourcemanager *, void *, um-
pire_allocator *)`

- Defined in `file_umpire_interface_c_fortran_wrapResourceManager.cpp`

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_for_ptr(umpire_resourcemanager
*self, void *ptr,
umpire_allocator
*SHC_rv)
```

Function `umpire_resourcemanager_get_allocator_for_ptr(umpire_resourcemanager *, void *, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
umpire_allocator *umpire_resourcemanager_get_allocator_for_ptr(umpire_resourcemanager
                                                               *self,      void     *ptr,
                                                               umpire_allocator
                                                               *SHC_rv)
```

Function `umpire_resourcemanager_get_instance(umpire_resourcemanager *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
umpire_resourcemanager *umpire_resourcemanager_get_instance(umpire_resourcemanager
                                                               *SHC_rv)
```

Function `umpire_resourcemanager_get_instance(umpire_resourcemanager *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
umpire_resourcemanager *umpire_resourcemanager_get_instance(umpire_resourcemanager
                                                               *SHC_rv)
```

Function `umpire_resourcemanager_get_size(umpire_resourcemanager *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
size_t umpire_resourcemanager_get_size(umpire_resourcemanager *self, void *ptr)
```

Function `umpire_resourcemanager_get_size(umpire_resourcemanager *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
size_t umpire_resourcemanager_get_size (umpire_resourcemanager *self, void *ptr)
```

Function `umpire_resourcemanager_has_allocator(umpire_resourcemanager *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
bool umpire_resourcemanager_has_allocator (umpire_resourcemanager *self, void *ptr)
```

Function `umpire_resourcemanager_has_allocator(umpire_resourcemanager *, void *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
bool umpire_resourcemanager_has_allocator (umpire_resourcemanager *self, void *ptr)
```

Function `umpire_resourcemanager_is_allocator(umpire_resourcemanager *, const char *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
bool umpire_resourcemanager_is_allocator (umpire_resourcemanager *self, const char  
*name)
```

Function `umpire_resourcemanager_is_allocator(umpire_resourcemanager *, const char *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
bool umpire_resourcemanager_is_allocator (umpire_resourcemanager *self, const char  
*name)
```

Function `umpire_resourcemanager_is_allocator_bufferify(umpire_resourcemanager *, const char *, int)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
bool umpire_resourcemanager_is_allocator_bufferify(umpire_resourcemanager *self,  
                                              const char *name, int Lname)
```

Function `umpire_resourcemanager_is_allocator_bufferify(umpire_resourcemanager *, const char *, int)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```
bool umpire_resourcemanager_is_allocator_bufferify(umpire_resourcemanager *self,  
                                              const char *name, int Lname)
```

Function `umpire_resourcemanager_make_allocator_advisor(umpire_resourcemanager *, const char *, umpire_allocator, const char *, int, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.cpp

Function Documentation

```
umpire_allocator *umpire_resourcemanager_make_allocator_advisor(umpire_resourcemanager  
                                         *self, const  
                                         char *name, umpire_allocator allocator, const char *advice_op, int device_id,  
                                         umpire_allocator  
                                         *SHC_rv)
```

Function `umpire_resourcemanager_make_allocator_advisor(umpire_resourcemanager *, const char *, umpire_allocator, const char *, int, umpire_allocator *)`

- Defined in file_umpire_interface_c_fortran_wrapResourceManager.h

Function Documentation

```

CONTRIBUTION GUIDE

This document is intended for developers who want to add new features or bugfixes to Umpire. It assumes you have some familiarity with git and GitHub. It will discuss what a good pull request (PR) looks like, and the tests that your PR must pass before it can be merged into Umpire.

7.1 Forking Umpire

If you aren't an Umpire developer at LLNL, then you won't have permission to push new branches to the repository. First, you should create a [fork](#). This will create a copy of the Umpire repository that you own, and will ensure you can push your changes up to GitHub and create pull requests.

7.1.1 Developing a New Feature

New features should be based on the `develop` branch. When you want to create a new feature, first ensure you have an up-to-date copy of the `develop` branch:

```
$ git checkout develop
$ git pull origin develop
```

You can now create a new branch to develop your feature on:

```
$ git checkout -b feature/<name-of-feature>
```

Proceed to develop your feature on this branch, and add tests that will exercise your new code. If you are creating new methods or classes, please add Doxygen documentation.

Once your feature is complete and your tests are passing, you can push your branch to GitHub and create a PR.

7.1.2 Developing a Bug Fix

First, check if the change you want to make has been fixed in `develop`. If so, we suggest you either start using the `develop` branch, or temporarily apply the fix to whichever version of Umpire you are using.

If the bug is still unfixed, first make sure you have an up-to-date copy of the `develop` branch:

```
$ git checkout develop
$ git pull origin develop
```

Then create a new branch for your bugfix:

```
$ git checkout -b bugfix/<name-of-bug>
```

First, add a test that reproduces the bug you have found. Then develop your bugfix as normal, and ensure to make test to check your changes actually fix the bug.

Once you are finished, you can push your branch to GitHub, then create a PR.

7.1.3 Creating a Pull Request

You can create a new PR [here](#). Ensure that your PR base is the `develop` branch of Umpire.

Add a descriptive title explaining the bug you fixed or the feature you have added, and put a longer description of the changes you have made in the comment box.

Once your PR has been created, it will be run through our automated tests and also be reviewed by Umpire team members. Providing the branch passes both the tests and reviews, it will be merged into Umpire.

7.1.4 Tests

Umpire uses Bamboo and Gitlab for continuous integration tests. Our tests are automatically run against every new pull request, and passing all tests is a requirement for merging your PR. If you are developing a bugfix or a new feature, please add a test that checks the correctness of your new code. Umpire is used on a wide variety of systems with a number of configurations, and adding new tests helps ensure that all features work as expected across these environments.

Umpire's tests are all in the `test` directory and are split up by component.

DEVELOPER GUIDE

8.1 Generating Umpire host-config files

This mechanism will generate a cmake configuration file that reproduces the configuration [Spack](#) would have generated in the same context. It contains all the information necessary to build Umpire with the described toolchain.

In particular, the host config file will setup:

- flags corresponding with the target required (Release, Debug).
- compilers path, and other toolkits (cuda if required), etc.
- paths to installed dependencies. However, Umpire only directly depends on CMake.

This provides an easy way to build Umpire based on [Spack](#) itself driven by [Uberenv](#).

8.1.1 Uberenv role

Uberenv helps by doing the following:

- Pulls a blessed version of Spack locally
- If you are on a known operating system (like TOSS3), we have defined compilers and system packages so you don't have to rebuild the world (CMake typically in Umpire).
- Overrides Umpire Spack packages with the local one if it exists. (see `scripts/uberenv/packages`).
- Covers both dependencies and project build in one command.

Uberenv will create a directory `uberenv_libs` containing a Spack instance with the required Umpire dependencies installed. It then generates a host-config file (`<config_dependent_name>.cmake`) at the root of Umpire repository.

Note: One common error that comes up when using Uberenv is that the `uberenv_libs` folder is out of date. To resolve, make sure this folder is deleted before running new scripts for the first time because this folder needs to be regenerated.

8.1.2 Using Uberenv to generate the host-config file

```
$ python scripts/uberenv/uberenv.py
```

Note: On LC machines, it is good practice to do the build step in parallel on a compute node. Here is an example command: `srun -ppdebug -N1 --exclusive python scripts/uberenv/uberenv.py`

Unless otherwise specified Spack will default to a compiler. It is recommended to specify which compiler to use: add the compiler spec to the `--spec` Uberenv command line option.

On blessed systems, compiler specs can be found in the Spack compiler files in our repository: `scripts/uberenv/spack_configs/<System type>/compilers.yaml`.

Some examples `uberenv` options:

- `--spec=%clang@4.0.0`
- `--spec=%clang@4.0.0+cuda`
- `--prefix=<Path to uberenv build directory (defaults to ./uberenv_libs)>`

It is also possible to use the CI script outside of CI:

```
$ SPEC="%clang@9.0.0 +cuda" scripts/gitlab/build_and_test.sh --deps-only
```

Building dependencies can take a long time. If you already have a Spack instance you would like to reuse (in supplement of the local one managed by Uberenv), you can do so changing the `uberenv` command as follow:

```
$ python scripts/uberenv/uberenv.py --upstream=<path_to_my_spack>/opt/spack
```

8.1.3 Using host-config files to build Umpire

When a host-config file exists for the desired machine and toolchain, it can easily be used in the CMake build process:

```
$ mkdir build && cd build
$ cmake -C <path_to>/lassen-blueos_3_ppc64le_ib_p9-clang@9.0.0.cmake ..
$ cmake --build -j .
$ ctest --output-on-failure -T test
```

It is also possible to use the CI script outside of CI:

```
$ HOST_CONFIG=<path_to>/<host-config>.cmake scripts/gitlab/build_and_test.sh
```

8.1.4 Using Uberenv to configure and run Leak Sanitizer

During development, it may be beneficial to regularly check for memory leaks. This will help avoid the possibility of having many memory leaks showing up all at once during the CI tests later on. The Leak Sanitizer can easily be configured from the root directory with:

```
$ srun -ppdebug -N1 --exclusive python scripts/uberenv/uberenv.py --spec="%clang@9.0.
  ↵0 cxxflags=-fsanitize=address"
$ cd build
$ cmake -C <path_to>/hc-quartz-toss_3_x86_64_ib-clang@9.0.0.cmake ..
```

(continues on next page)

(continued from previous page)

```
$ cmake --build -j  
$ ASAN_OPTIONS=detect_leaks=1 make test
```

Note: The host config file (i.e., hc-quartz-...cmake) can be reused in order to rebuild with the same configuration if needed.

This will configure a build with Clang 9.0.0 and the Leak Sanitizer. If there is a leak in one of the tests, it can be useful to gather more information about what happened and more details about where it happened. One way to do this is to run:

```
$ ASAN_OPTIONS=detect_leaks=1 ctest -T test --output-on-failure
```

Additionally, the Leak Sanitizer can be run on one specific test (in this example, the “replay” tests) with:

```
$ ASAN_OPTIONS=detect_leaks=1 ctest -T test -R replay --output-on-failure
```

Depending on the output given when running the test with the Leak Sanitizer, it may be useful to use `addr2line -e <./path_to/executable> <address_of_leak>` to see the exact line the output is referring to.
